LETTER FROM THE MANAGING DIRECTOR

Since ancient times, the cow has been a symbol of wealth in India. It was venerated by Mahatma Gandhi. It's no surprise that India is the home to the world's largest herd of domesticated cattle. Intuitively, this implies that India should be the global leader for dairy products. However, this is far from reality. While India is the largest producer of milk, it is not known for its dairy products. Even as Indian per capita dairy consumption has increased three-fold in the last forty five years, it is significantly lower than the global average. No wonder the industry growth continues to remain high and business opportunities abound.

However, these opportunities come with great challenges. Unlike the developed markets where examples of successful dairy businesses are rife, the Indian market has evolved very differently. Co-operatives such as Gujarat Cooperative Milk Marketing Federation (GCMMF), owner of the iconic brand Amul, dominate the market. While this scenario will persist, private players are slowly finding their footing and exploring innovative business models.

Our cover story on the Indian dairy industry – penned by our research analysts Naveen Kulkarni and Jubil Jain – delves deep into the nuances of the rising industry. It explores the business models, product mix, and long-term strategy required to succeed in this business. Also read in this issue, an interview with Dr Velumani, CMD of Thyrocare, where he talks about the trends and developments in the fast-growing and exciting diagnostics industry.

Best Wishes

Valuation Summary

COVER STORY

"We used to find it very hard to make our daughter drink milk. A friend of mine told me about a premium milk brand based on the concept of farm to home. We liked the idea and called up their customer care number. They started delivering the bottles in a couple of days. While I found it difficult to differentiate the quality, my daughter immediately took to its taste. My parents say this is the kind of milk they used to have during their childhood back in villages. My monthly milk bill is up more than 2x, but I feel it's worth it," says Padmanabhan Ramadas of Khoparkhairane, about the premium milk brand Pride of Cows. Premiumisation in liquid milk is a challenging concept, but recently, brands such as Pride of Cows or Sarda Farms are trying to carve out a niche for themselves (positioning) by catering to quality-conscious consumers. It now seems that an industry, which has punched significantly below its weight – has finally arrived.

Dairy business in developed markets is lucrative – some of the most valuable companies in the world (Nestle, Kraft, and Danone) have made their fortunes in this space. However, India's dairy landscape has been markedly different from the developed world – no major company (except maybe Nestle) has made an impact here. This is quite surprising, considering that India is one the world's largest producer and consumer of dairy products. Nevertheless, the Indian economy, marked by the trend of rising consumerism, holds immense potential for the dairy industry. For companies to realise the full potential of this lucrative industry, it is imperative for them to get the business mix right and to have the ability to invest in the long-term. Whichever way one looks at it, it seems like the dairy industry's time has come.

BY NAVEEN KULKARNI & JUBIL JAIN

Highly sensitive, but largely unorganised

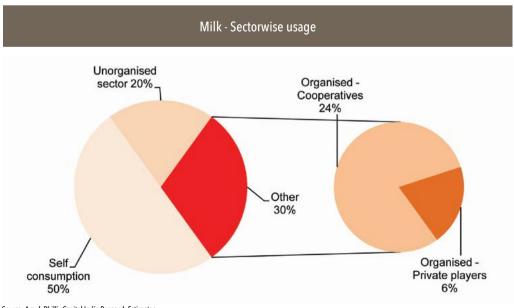

n India, dairy is a very sensitive industry because of the sheer number of people involved. "The welfare of farmers and animals is the most critical aspect of the business," says Mr R S Sodhi, MD of Gujarat Cooperative Milk Marketing Federation, which markets its products under the iconic brand Amul. The number of people involved in the dairy industry in India is the largest in the world. However, the industry is still largely unorganised. Small farmers (who do not own more than two animals) produce nearly 80% of milk. Because of this, most farmers are unable to get advantages of mechanisation that large herds can avail of - hence, milk yields in India are very low. The World Society for the Protection of Animals pegs India's average yield per dairy cow per

year at 1.3tonnes vs. 6.2tonnes in the European Union and 9.1tonnes in the United States.

It is not just the milk sourcing, it is also the structure - the unorganised sector accounts for 70% of total volumes. Half of the 140mn tonnes of milk produced in FY14 was consumed at source. Out of the remaining 70mn tonnes, 28mn tonnes or 40% was sold to the organised sector and the rest to the unorganised sector. Co-operatives dominate the organised dairy industry (80% of revenue) because of raw-material sourcing dynamics working in their favour.

- Due to small average herd sizes, milk yields in India are far below global averages

- The unorganised sector accounts for 70% of India's total dairy volumes

Source: Amul, PhillipCapital India Research Estimates

Co-operative is king....

Sourcing is the key, therefore co-operatives have dominated India's organised dairy industry so far

Because of the highly fragmented and unorganised nature of the industry in India, co-operatives have become the primary business model. Their success is based on two major facets of their business model:

- Milk-farmer members own the shares of a co-operative, whose objective is sustainable input cost maximisation and co-operatives work on a no-profit no-loss principle, thus benefitting farmers. This is unlike private players, whose objective is to increase profits sustainably.
- 2. Co-operatives' mandate is to procure all the milk that farmers can supply at a set price, regardless of the demand. This provides small farmers with security.

The co-operative model has enabled small milk farmers to command a lion's share of profits from their produce and to reduce their financial insecurity – a report by the World Society for the Protection of Animals says that small-scale (often landless) milk farmers in India get to retain 77% of the total price paid by consumers. In comparison, producers in Germany retain only 48% and farmers in the United States only 45%.

In India, most state cooperatives follow a three-tiered structure, also known as the Amul model:

- Village-level 'Dairy Co-operative Societies' (DCS) collect surplus milk from farmer members
- District-level 'Milk Unions' collect milk from all DCS' in the district, process, and market it
- State-level 'Federation' provides marketing services and other support to District Milk Unions

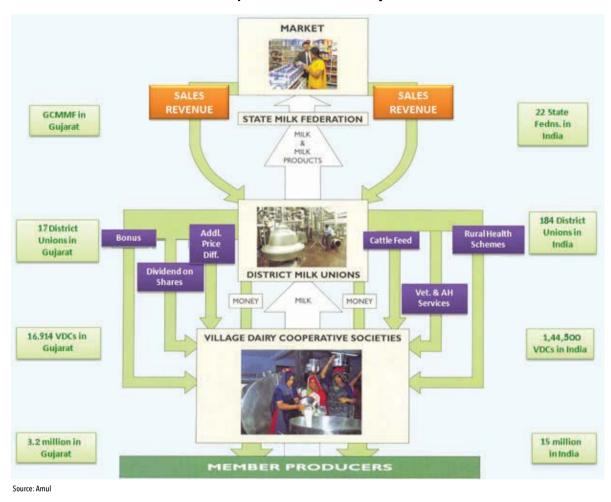

Three -tiered milk co-operative structure in India

Source: Amul

Indian milk producers (majority of whom are farmers) retain a large share (77%) of the price that consumers pay for the milk

Co-operative structure in Gujarat

...but, co-operative is not always a very strong king

In Gujarat and Karnataka, state co-operatives direct all district co-operatives to market products under a single umbrella brand (Amul for Gujarat and Nandini for Karnataka). In other states, such as Maharashtra, the co-operative structure is weak and each district milk union markets goods under a different brand (Katraj in Pune, Gokul in Kolhapur).

The Managing Director of a district cooperative in Maharashtra (who did not wish to be named) says, "States that have a common state-wide dairy brand have outperformed weaker ones that don't have one. This is because of consistency and economies of scale in marketing products, which helps strong states strengthen their sales and distribution chain." He explains what is wrong with the state-controlled side of Maharashtra's dairy industry – "In Maharashtra, the state co-operative markets products under the Mahananda brand, which is distinct from district-level brands like Katraj, Gokul and others. To complicate things further, the government of Maharashtra also markets dairy products under a distinct Aarey brand. In Maharashtra, as district milk unions, state cooperatives, and the state government compete amongst themselves for market share, individual brands lose their economies of scale, impacting sales potential for cooperatives – thereby paving the way for private dairies."

Besides sourcing skills, the presence of a strong single state-wide brand seems to be the cornerstone of a co-operative's success

Pune co-operative brand - Katraj

Kolhapur co-operative brand - Gokul

Ahmednagar co-operative brand - Rajhans

ENERGEE ENERGE E

Maharashtra state co-operative brand - Mahanand

Maharashtra government brand -Aarey

In Maharashtra various brands of district and state co-operatives, and government compete among themselves for market share. In contrast, in Gujarat all district and state co-operatives market milk under common brand Amul

Farmers suffer because of a weak co-operative

While Gujarat co-operative's Amul brand has been a success story and competes with not only strong domestic brands, but also with global ones, Maharashtra's local co-operative brands (Mahananda and others) have been ineffective in competing with other co-operatives and private brands. This has adversely affected the bargaining power of milk farmers. "In Maharashtra, where procurement prices for milk have reduced to as low as Rs 15-16 from Rs 25-27, the situation is particularly exacerbated because of lack of a strong cooperative. In Gujarat, the situation is much better because our procurement prices are significantly higher", says Mr R S Sodhi of Amul.

to be stronger in villages with lower access to organised banking. In these villages, small farmers borrow funds from local landlords, and in many cases from private milk collectors. These small farmer-borrowers, in many cases, repay milk collectors in kind – by supplying milk. As farmers develop an association with private milk collectors, and once the latter become a reliable source of funds, farmers begin selling milk regularly to these private milk collectors, despite co-operatives offering higher prices.

Room for all, even in the long term

The business models of private players and co-operatives are in perpetual conflict, but India is and will continue to be a surplus producer of milk with a very large unorganised market (even in the very long-term), and this provides room for all types of players. However, co-operatives have been aggressively competing for market share, keeping selling prices low – this has impacted the quality of products and profitability of the industry.

Private dairies and bulk milk collectors – the cogs in the wheel

Milk co-operatives not only offer farmers among the highest prices for milk procurement, but also have a mandate to purchase all the milk that a farmer sells, irrespective of near-term demand. Private dairies and bulk-milk traders, which generally procure milk at lower/equal prices, also play an important role in milk production. Prabhat Dairy sources 65% of its milk directly through farmers and buys the rest from bulk-milk vendors. Kwality Dairy procures as much as 85% of its milk from vendors.

Why should private milk collectors exist?

Even as co-operatives offer the highest procurement prices to farmers and buy all the milk for sale, private dairies and bulk-milk vendors tend Co-operatives' practice of keeping selling prices low and maximising buying prices has affected the quality of products

Subsidies offered to co-operatives embolden the strong ones

For nearly three years (from July 2013 to January 2016) the Karnataka government provided a subsidy of Rs 4 per litre to dairy producers and families. In January 2016, the government increased this subsidy to Rs 7 per litre. As a result, farmers in Karnataka get ~Rs 28 per litre for cow milk (includ-

ing Rs 7 in subsidy). In such states, private dairy players' profitability and business model comes under threat due to such high procurement prices. Hatsun Agro, a key private player in the south, procures milk directly from farmers in Tamil Nadu and Andhra Pradesh - but it does not have direct sourcing capability in Karnataka.

Some co-operatives become stronger because of government aid and manage to expand their presence in states or districts with weaker co-operatives. The weaker cooperatives find it challenging to survive when strong cooperatives such as GCM-MF or Nandini come to challenge them in their turf. To maintain profitability, the milk procurement prices in weak states drop and private players begin to co-exist with co-operatives (procurement prices drop as no major co-operative is in a strongenough position to set prices for the market to follow). In Maharashtra, milk procurement prices are significantly lower than those in Karnataka. As a result, private players in Maharashtra like Parag Milk Foods and Prabhat Dairy have been able to set up a local sourcing chain from farmers.

In developed markets, reconstituted milk is sold at a significant discount to fresh milk. This form of adulteration is one of the minor ones. Adulteration of milk happens throughout the supply chain in India and it is one of the biggest problems of the dairy industry. This means that there is a huge opportunity for the supply of high-quality milk. However, the economics of the business are rather complex and profitability is a challenge. Recently, private players such as Parag established brands based on the 'farm-to-home" concept by following global benchmarks of quality and freshness. Growth was superlative, but profitability and scale remain a challenge because of the huge fixed-cost structure of the industry. Even so, it seems that the Indian dairy industry - with a vast array of products being introduced and private players willing to commit significant capital - has truly arrived.

DID YOU KNOW? Some of the milk that you consume or buy as 'fresh milk' is actually reconstituted milk!

Quality suffers with intrepid Tired and old jerseys - an competition

"What is pure in today's market? Every other product is adulterated. Likewise, milk and milk products are also adulterated. It is a knife fight in the market. Nobody can compete fair," reveals the MD of a leading milk co-operative in Maharashtra. Milk is a seasonal product with rising production during winters while production declines in the summer. Excess production of the winter season is stored in the form of milk powder, which is a global commodity. In cities such as Mumbai, where there is a significant gap between demand and supply, the share of reconstituted milk (milk made from milk powder) is very high. Milk vendors do not label milk as reconstituted, and pretty much everything is sold as fresh milk.

underinvested industry!

The Managing Director of a leading co-operative in Maharashtra tries to explain the competitive relationship between Maharashtra's co-operative and government milk company with a hilarious cow and bull analogy - "The conflict between the two bulls for the cow has raged on for decades, making them so tired that a third bull was able to exploit the opportunity," he chortles. In Maharashtra, the government milk company is Aarey while the state also has quite a few cooperative brands. The battle for market share resulted in the weakening of both Aarey and co-operatives,

Indian dairy negatives -> lower profitability than global average -> lower investment -> lower productivity and lower quality products

11

which in turn led to private companies winning market share. In Maharashtra, milk procurement prices are now one of the lowest in the country, as no major co-operative has been able to set prices for the market to follow. This has not only helped private players establish their business models, but cooperatives from other states have also forayed into the market.

This phenomenon is seen across many states – private players have been able to establish their brands, but the profitability of the industry is significantly lower than in developed markets. Lower profitability meant that investments have been below par while in reality this industry requires huge investments in supply chain, factories and farms. Due to this, the number of dairy brands known for their quality is very few.

Indian dairy positives -> growing per capita consumption, growing scope for value-added products and premiumisation

Per capita consumption of milk globally

| Per capita consumption (litres/year) | |
|--------------------------------------|-----|
| US | 285 |
| EU27 | 281 |
| Russia | 220 |
| Brazil | 156 |
| India | 97 |
| China | 24 |

Source: IMARC report

Although profitability is low for the industry, growth is not a concern. The per-capita consumption of milk is growing, but more importantly, value-added products are growing faster. This segment has higher gross margins and immense scope for premiumisation. However, there is a catch – value-added products and liquid milk supply chain economics are inextricably linked to each other.

Nothing cheesy about them!

ue-added products. The dairy industry supply chain rides on milk and its procurement," says Mr RS Sodhi of GCMMF. Milk has two constituents - fat and SNF (solid non-fat). Fat can be used for making butter, ghee, and other value-added products, but after extracting the fat, the SNF has to be sold. If milk is sold separately while a company only focuses on the supply-chain for value-added products, then the supply-chain economics do not work out in a fiercely competitive market.

obody can survive selling only val-

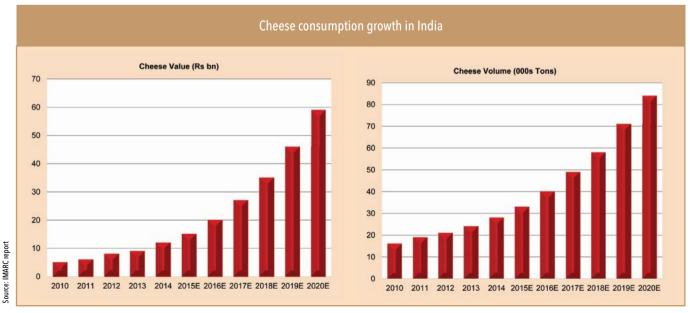

While supply-chain economics are challenging, cheese presents an interesting proposition. The by-product for cheese is whey, but it is produced in limited quantities. The market for cheese is large in developed economies. Some of the biggest companies of the world, such as Kraft, built their businesses on producing high-quality cheese.

Cheese is among the more profitable value-added milk products with gross margins higher than 25% vs. ghee with 5-10% margins

The value addition in cheese can be significant, as aging is a critical component in manufacturing of cheese. The level of premiumisation that cheese offers is absent in any other dairy product. While premiumisation opportunities are significant, and there is a global precedence of successful business models built on cheese, the market for cheese in India is rather limited currently. It is seeing magnificent growth rates, but hasn't become a standard grocery item such as ghee or butter.

Cheese-making commands higher gross margins than ghee, because it is a complex process. Cheese requires aging of three months or more, depending on the grade. This aging is done in cold storage, which significantly pushes up the

While cheese could technically be a successful business by itself, the market for cheese in India (so far) is limited

Low margin products share

working capital and fixed capital requirements. The return on investment on cheese depends on the retail and wholesale (institutional) mix as well as the ability to utilise capacity. Moreover, the wide range of cheese – from basic mozzarella to exotic varieties – offers significant brand-building avenues. A recent example is Parag Dairy's introduction of a premium cheese spread under the brand name Almette. Building brands in dairy businesses has been challenging, and only products that command pricing power can be considered brands. However, established brands can command a premi-

um to regional and local products and generate higher gross margins.

Apart from cheese, the range of value-added products is quite large in India. These products are less impacted by changing global commodity prices. For example, in the current scenario of a sharp correction in global skimmed milk powder (SMP) prices, domestic ghee prices have been relatively steady. The decline in global SMP prices has led to a complete stalling of SMP exports from India. Private players involved in SMP exports have significantly reduced their

procurement of milk, and cooperatives have had to step up procurement. For the dairy industry, in the current scenario, ghee and buffalo milk (with higher fat content) have emerged as saviours. Buffalo milk prices are expected to bounce back as the lean summer season ensues.

"It is the buffalo that is probably going to save the dairy farmer," believes Mr RS Sodhi, "as cow's milk and SMP continue to remain under pressure".

Other high-margin value-added products like UHT (ultra-high-temperature) milk and flavoured milk provide gross margins of around 50% and 70% respectively. However, the capital investment required for such products is high due to the complex nature of operations and asset turnover tends to be in low to mid-single digits.

Needless to say, a wide portfolio of value-added products is critical to the dairy business model, but so is liquid milk, as it forms the key cog of the supply-chain and branding.

The supply-chain and branding enigma of the dairy industry

"If I have to pick the most critical success factor for the dairy business, it has to be the supply chain. We calculate supply

For a dairy producer, an efficient supply chain is far more important than for other industries, partly because of the perishable nature of the commodity

chain costs in paise and we keep our costs very low, which helps us to win markets," says Mr Sodhi. In dairy, everything depends on efficient supply chain. Product quality to profitability – all depend on its efficiency. Most dairy products are highly perishable and require cold chains. A cost-efficient supply chain is a pre-requisite for most industries, but in dairy, these efficiencies go much further. The biggest hurdle in the dairy business is to build brands, and brands need to be scalable. The answer lies in managing supply-chain dynamics.

Consumer-facing businesses are all about brands. These have pricing power and are able to withstand the vagaries of economic cycles. The dairy industry is very large, but since it is dominated by co-operatives, the challenge for companies has been to build brands, considering lower gross margins across products. This, however, is not the only difficult aspect; the bigger challenge in the dairy industry has been to build brands by distributing liquid milk, which while providing unparalleled customer reach, is a rather dull business with EBIDTA margins of around 5%. Nevertheless, it has multiple advantages, which most private companies fail to commit to

Pictures of Kwality Dairy's Faridabad factory; Dairy industry requires very high capex

over the long term. The biggest advantages are:

- Supply of quality milk provides a direct connect with end consumers at lower costs and results in branding
- Provides economies of scale; plus, it is a cash business with lower working capital requirements
- Brings down the supply-chain costs on which other products can ride

All these three big advantages are a must for building a scalable consumer business, but the challenge is the 'right to win' in building such a consumer-facing franchise. Most FMCG companies ask themselves three 'right to win' questions:

- Do we have any special skill or advantages in sourcing of products?
- Do we have the brand/branding capabilities?
- Do we have the distribution infrastructure?

For most companies, getting a positive answer for any two of these equals a green signal to develop those products.

Dairy is an exciting and lucrative segment (when done right) and most FMCG companies keep mulling over cost-effective ways of tapping into it

However, in dairy, companies need to get all three questions right. This seldom happens, but companies that do, go on to build scalable businesses. Gujarat Cooperative Milk Marketing Federation, owner of the iconic Amul brand, met all the criteria and has exceeded expectations. Hatsun Agro is another company that built a strong brand and capabilities, while Parag Milk Foods is the other player that managed to build a robust business model. These models have met with success because of their long-term vision.

Extending brands to dairy: Strategy still in the lab

Building dairy brands are long-gestation projects. Companies have to slog in the retail channels with low-margin products, consistently improve efficiencies, and build higher-margin value-added products. All this is a fairly long process. Brand extensions are a seemingly easier route to brand building in this segment, but the efficacy of this method is not fully proven. Some of the leading FMCG companies have forayed into the dairy business through brand extensions. Britannia and Nestle are developing their dairy franchise around the flagship brand. Nestle has met with the most success, primarily because of its first-mover advantage in infant nutrition and

dairy creamer. The infant nutrition category is also impacted by regulatory hurdles (not allowed to advertise), but Nestle was able to take advantage of market conditions when regulatory hurdles were much lower. In the dairy-creamer category too, the company enjoyed first-mover advantage and it was able to build a very successful brand. Nestle's success in these two products has not been repeated by any other player; in fact, even Nestle itself could not repeat its success in other dairy categories, notwithstanding global expertise and experience.

Britannia and ITC both have ambitious plans for the category, but do not seem to have a coherent strategy in place yet. However, since these companies have strong brands, experience in sourcing, and supply-chain management capabilities, the 'right to win' is seemingly inherent. Strategically, most FMCG companies shy away from low-margin businesses such as liquid milk, as they find capital-efficiency lacking; their preference is mostly towards high-margin categories. The success of this strategy is yet to be proven or probably the market is still to reach that inflection point to make a significant impact.

In this context, the dairy market has surely not reached an inflection point for growth to take off, but more importantly, products like cheese, dahi (curd), or tetra-pack milk by

leading FMCG players are yet to capture the people's imagination. In all probability, the success for this kind of a strategy would lie in a company's ability to introduce new innovative products that find wide acceptance and still have high margins. For now, the big boys of FMCG are in a 'wait-watch-development' mode for distruptive

innovations.

(Britannia and Nestle have strong presence in Dairy; ITC with its Aashirvaad Svasti ghee is the latest major FMCG entrant in the fray)

Crude is not the only product flooding the world

While the commodities and therefore financial markets suffer from the impact of an oil glut, for the farmer community the oversupply of another commodity (less talked about but more impactful) has been wreaking havoc globally since last two years - milk!

Global milk prices have been falling since the past two years, led by increasing supply from all major producers

amidst falling demand from China and Russia. While the milk production of top-5 exporters increased consistently, milk import demand from China fell ~30% in the last two years due to slowing down of demand growth and strong growth in domestic production.

Falling milk prices led to a drop in prices of most

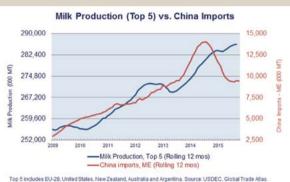

dairy products globally. In the last two years, milk prices dropped 35% and skimmed milk powder prices dropped 60%.

Even though India consumes most of its domestic production and is therefore not a big exporter, falling prices have impacted Indian markets too, albeit to different extents on different products. While prices of milk have increased by 11% in last two years due to the dominance of co-operatives, prices of skimmed milk powder have fallen in line

with global prices (by 60%).

Marc Beck (VP Strategy, US Dairy Export Council) says "It may be 2017 before we return to a scenario where global supply and demand for milk are more closely aligned." This is because the key factors necessary to deliver better market balance — production contraction, inventory reduction, and China buying a baye yet to

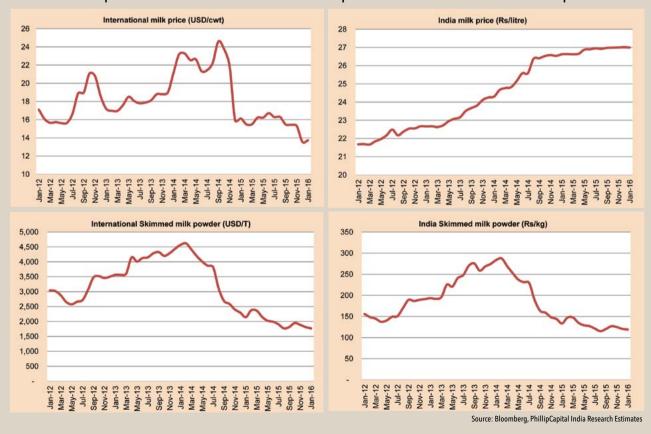

and China buying — have yet to materialise.

While milk production for top 5 exporters has risen over the years, China's dairy imports have fallen

Source: US Dairy Export Council

Indian milk prices have not corrected in line with international prices as has been the case with skimmed milk powder

AMUL - WISH YOU WERE LISTED!

When milk became a symbol of protest

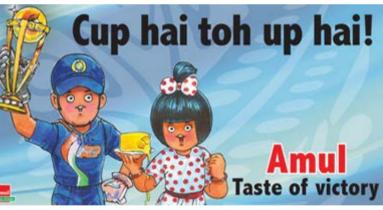

he seeds of this unusual saga were sown more than 70 years ago in Anand, a small town in Gujarat in western India. The exploitative trade practices followed by the local milk trade cartel triggered off the co-operative movement. Angered by unfair and manipulative practices that were followed, farmers of the district approached Sardar Vallabhbhai Patel for a solution. He advised them to get rid of middlemen and form their own co-operative, which would keep procurement, processing, and marketing under the farmers' control. In 1946, farmers of Anand went on a 'milk strike', refusing to be cowed down by the cartel. Under the inspiration of Sardar Patel, and the guidance of

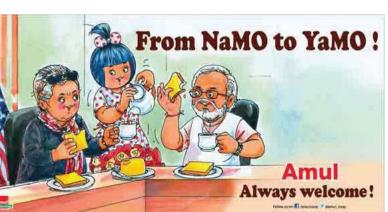

leaders like Morarji Desai and Tribhuvandas Patel, they formed their own cooperative in 1946, which later evolved into a state-wide dairy cooperative – today known as Amul.

Biggest and the best!

Amul, flagship brand of Gujarat Cooperative Milk Marketing Federation (GCMMF), is the most successful co-operative brand in the country, and

Amul is credited with spurring the 'milk revolution' of India, which propelled the country to becoming the world's largest producer of milk

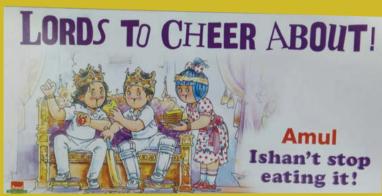

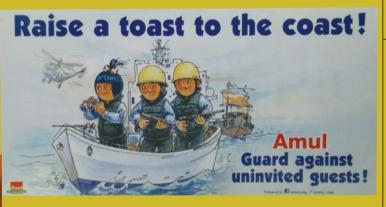

Amul's iconic hoardings

India's largest fully integrated food brand. With 21% CAGR in last five years, Amul posted revenues of Rs 207bn in FY15. Its product portfolio includes liquid milk and value-added products like infant nutrition, cheese, and butter. Amul has a pan-India presence with 56 sales offices, 10,000 dealers and a million retailers. It handles 15mn kg of milk per day (~4% of India's total dairy volumes and 25% of organised sector volumes) and is also India's largest exporter of dairy products.

Strong brand backed by stronger distribution

Amul's retail sales are driven by liquid milk, which accounts for around 50% of production volumes. Liquid milk acts as the carrier brand for its value-added products such as infant milk food, cheese, paneer, flavoured milk, and ghee. Milk is the largest contributor to its revenues (Rs 80bn PC estimate). Its second-largest category is infant milk food, Amul Spray, which has revenues of Rs 42bn. Other important categories include butter (market share of >90%), ghee, ice creams, and cream. Because of its strong brand equity and retail portfolio, Amul operates on cash-and-carry principle and

Amul owns +90% market share in butter

has negligible receivables (two days). In comparison, companies like Kwality Dairy, Prabhat Dairy, and Parag Milk Foods have major institutional presence and receivables days of 40-80.

Listed cooperative: Fonterra case study

Fonterra Co-operative Group Ltd. is a New Zealand dairy co-operative owned by 10,500 farmers. It is the world's largest dairy co-operative and exports 95% of its local production to over 100 countries. The company is also

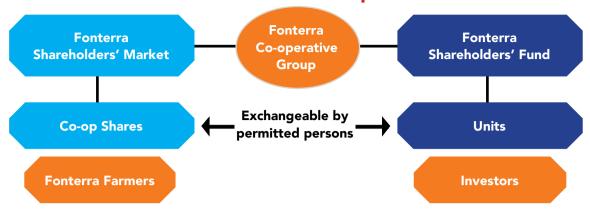

known for being one of the few dairy cooperatives listed on a stock exchange.

Until November 2012, Fonterra shares were owned only by its milk-producing members in the ratio of amount of milk produced by each member. Members could then redeem these shares if their production declined, and the cooperative was obligated to buy back the shares from these members. In 2007-09, due to volatility in milk prices, Fonterra faced severe redemption pressures from struggling farmers.

In November 2012, Fonterra implemented a capital structure that allowed it to list its shares on New Zealand's stock exchange, while letting farmer members retain ownership of shares. As per the structure, derivative units of underlying cooperative shares are available to investors and these units entitle investors to receive economic rights to the shares (dividend and gain/loss in unit value). The units could be transacted freely on the stock exchange. However, since farmers retain ownership of shares of the cooperative, voting rights were made available only to them. The structure also allows farmers to purchase shares worth two times than previously available for their three-year average production. This helped increase market depth. Fonterra shares currently trade at more than 19 times trailing earnings and the company has a market capitalisation of US\$ 6bn (NZD 9.1bn).

Fonterra's new capital structure

Key features

- Can trade Co-op shares
- Voting rights
- Restricted to dairy farmers
- Market maker operates
- Operated by NZX

Source: Nicola Shadbolt and Alex Duncan, Quebec 2014 International Summit of co-operatives

How big would Amul be if it were private and listed? (Hint – a lot!)

A large dairy company with a stable of strong brands can command FMCG valuations if it is able to exhibit lean working capital management and if a bulk of its business comes from retail. Amul is one of the most admired brands in India and has a track record of consistent growth. GCMMF, in a hypothetical scenario of operating like a private dairy company, would command valuations of a large FMCG company in India. It is even likely that it might command a scarcity premium because of dearth of investable candidates in the dairy space.

Based on the gross margin profile of listed players and Amul's product portfolio, its gross margins would be around 20% (instead of 4.7% currently) had it been private. Amul currently makes lower gross margins because it buys milk at higher prices (in line with its objective of input cost maximisation) than most private players and private milk collectors, and it has a mandate to buy all the milk supplied by farmers no matter what the demand, which leads to overspending. With higher gross

Key features

- Can trade units
- Units can be converted into Co-op shares by farmers
- Non voting rights in co-op
- Institutional and retail investors

- Listed on NZX and ASX

Amul mould be more profitable if it were private

| FY2015 (Rs mn) | Actual | Had Amul been private |
|--------------------|---------|-----------------------|
| Sales | 207,504 | 207,504 |
| COGS | 197,732 | 166,003 |
| Gross Profit | 9,772 | 41,501 |
| Gross margin (%) | 4.7 | 20.0 |
| Operating expenses | 8,659 | 8,659 |
| EBITDA | 1,113 | 32,842 |
| EBITDA margin (%) | 0.5 | 15.8 |
| PAT | 415 | 21,683 |
| PAT margin (%) | 0.2 | 10.4 |

Source: Company, PhillipCapital India Research Estimates

margins and other costs remaining the same, Amul would have generated profits of Rs 21bn in FY15 instead of reported profits of Rs 0.4bn. At an FY15 profit of Rs 21bn, and a conservative trailing P/E multiple of 30x, Amul would have a market capitalisation of Rs 630bn (~US\$ 9bn) – one and half times the size of Fonterra!

Amul would have a market capitalisation of Rs 630bn (~US\$ 9bn) if it were private and listed

THE SIGNIFICANT OTHERS

Hatsun Agro: Done with the heavy lifting

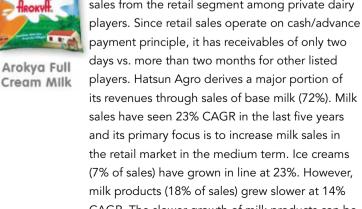

any people in India do not know about Hatsun Agro, but most people in south India know Arun ice cream. It is a brand that reaches most cities in south India and has one of the best distribution networks for an ice cream brand in India. Apart from Arun ice cream, Hatsun Agro's liquid milk brand, Arokya, is well established and it has managed to successfully hold its turf in the highly competitive Tamil Nadu market, where the state cooperative brand Aavin is very strong. Hatsun's success is built on slow-and-steady growth with an eye on the long term.

The Chennai-based Hatsun Agro Products was founded in 1986 and it is listed on the BSE since 1996. It is one of the largest private dairy players in the country. It serves Tamil Nadu (60% of sales), Andhra Pradesh, Telangana, Karnataka, and Maharashtra. The company operates majorly in the retail segment and its product portfolio includes milk, ice creams, and other value-added products. With a capacity of 2.5mn litres of milk per day, it currently handles 1.9mn litres of milk per day and has manufacturing plants at 12 locations.

Lean and strong - tricks of the trade

At 90%, the company has the highest share of sales from the retail segment among private dairy payment principle, it has receivables of only two days vs. more than two months for other listed players. Hatsun Agro derives a major portion of sales have seen 23% CAGR in the last five years and its primary focus is to increase milk sales in the retail market in the medium term. Ice creams (7% of sales) have grown in line at 23%. However, milk products (18% of sales) grew slower at 14% CAGR. The slower growth of milk products can be

attributed to (1) more focus on growing milk sales, and (2) lower focus on working-capital-intensive institutional business for milk products.

will affect Hatsun Agro's procurement model in Karnataka.

Some risks with its retail model...

The company is prone to regulatory challenges like milk subsidies given by state governments to co-operatives. For example, in July 2013, the newly elected government in Karnataka doubled the subsidy to dairy farmers in the co-operative sector to Rs 4 per litre from Rs 2 per per litre. From 5th January 2016, this subsidy was increased further by Rs 3 per litre. Currently, Hatsun Agro directly procures milk from farmers in Tamil Nadu and Andhra Pradesh, but in Karnataka, it procures milk only from dealers. We believe further involvement of government in milk procurement markets

..but it has what it takes to succeed

Hatsun Agro is one of the few private dairy companies that has its act right. Its huge retail presence because of sale of base milk has helped it to create robust sourcing and distribution infrastructure. This would help to make its business model more sustainable going forward. Capex and working capital are under control because of right selection of its product portfolio and sales channels. As the company grows larger and starts increasing its presence in value-added products, it will start seeing operating leverage and register double-digit growth in revenues and earnings.

Kwality Dairy: Moving up on the value chain

Kwality's name rings a strong bell as one tends to immediately connect it with its namesake Kwality Walls. However, in its current form, Kwality Dairy has little to do with Kwality Walls and it cannot use the Kwality trade mark to sell its products. It markets its products under the brand Dairy Best.

Delhi-based Kwality Dairy was originally set up in 1992 as a backward integration unit of Kwality Ice Creams. The Kwality brand was acquired by Brookebond, which later merged with HUL. However, the dairy was acquired by current promoters in 2003 and has become one of the largest private dairy players in north India, catering majorly to

23

the urban market of Delhi. It has milk processing capacity of around 3mn litres per day with six plants in Haryana, UP, and Rajasthan. It produces a variety of dairy products and is in the process of commissioning new facilities that will help generate additional revenues from the sale of higher-margin value-added products.

Light and heavy

Kwality Dairy's gross margins at 11% are far lower than other key private players' such as Hatsun

Agro and Prabhat Dairy (22-25%), because of a higher proportion of lower margin products such as ghee and skimmed milk powder in its portfolio. As gross fixed assets required to produce low-margin products is lower, its gross-fixed-assets to turnover is 42 vs 3.2/3.3/3.6 for Hatsun Agro/Prabhat Dairy/Parag Milk Foods.

However, due to significant institutional sales (69% in FY15), its receivable days are very high at 80 and it has short-term borrowings of Rs 10.9bn for annual sales of Rs 41.5bn. While it used to earlier operate majorly in the B2B segment,

(Title: Kwality Dairy majorly produces low margin products like ghee, skimmed milk powder, ghee. etc.)

it has increased its retail sales proportion to 31% of sales by FY15 from from 9% in FY10. Retail sales will be augmented by expansion at its Softa plant (by 0.85mn litres per day) to produce primarily value-added products such as flavoured milk, variants of cheese, UHT milk, butter in tubs, cream in tetrapacks, etc. The addition of high-margin milk products for the retail channel will also help to improve gross margins, increase revenue and reduce working capital days.

Inflexion point still away

Once its new capacity addition at the Softa plant becomes operational, the company will have the ability to increase presence in the retail segment. However, currently, it is severely dependant on sales of low-margin milk products to institutional clients and it will take time for the company to decrease this dependence. This is because it has huge working capital employed in the institutional business and needs steady income to service its debt annually. Thus, institutional sales will continue to form a significant part of its revenues for some time and working capital will remain high.

Prabhat Dairy: Seeking fortunes at the middle of the pyramid

"We will boost sales of our retail portfolio by making available quality products to the tier-2 and tier-3 markets," says Ahmednagar-based Prabhat Dairy, a key private dairy player in Maharashtra. While tier-1 markets are highly penetrated and see fierce competition among various players, tier 2-3 towns are often less penetrated and have benign competition. Prabhat Dairy was incorporated in 1998 and listed on the BSE in 2015. The company has two manufacturing facilities with an aggregate milk-processing capacity of 1.5mn litres per day and handles 0.95mn litres a day. The company

operates majorly in the B2B segment (72% of sales in Q2FY16) and has partnerships with many major food players.

or non-existent. We believe that the company can expand the category in tier 2/3 markets through strong distribution and promotions, and gain share in tier-1 markets through trader incentives.

Better ingredients, better business

"Dairy business typically has three major lines – ingredients, consumers, and professional services. We chose the ingredients business because of the lack of a credible player in this space that has the capability to supply quality products. We positioned ourselves on manufacturing excellence, which appealed to international companies like Modelez and now we supply to them globally," says Amit Gala, CFO of Prabhat Dairy.

In 2006, Prabhat entered the dairy ingredients space, which did not have the presence of a strong domestic company. Driven by manufacturing excellence, it has built partnerships with top FMCG players such as Kraft Foods, Mondelez, Britannia, Nestle, and others. The company has very high receivable days (66) because of the payment policies of top FMCG companies to vendors.

Milking tier 2/3 markets

While the company is very strong in the institutional segment (72% of sales in Q3FY16), it wishes to gradually increase the share of sales from retail. While retail markets of tier-1 cities are rife, the company plans to penetrate tier-2 and tier-3 towns where the presence of major dairy brands is lower

High and dry

While both Prabhat Dairy and Kwality Dairy have a high proportion of sales coming from institutional segments, Prabhat's dairy gross margins are higher at 22% vs. Kwality Dairy's 11%, because the former manufactures high-margin value-added products like condensed and concentrated milk and cheese. The largest product for the company is condensed milk (25% of sales) and it has the third-largest cheese-manufacturing capacity in the country and produces 1000 tonnes per month. The company has a huge fixed assets base, as it produces higher-margin products and has gross asset turnover of 3x vs. 40x for Kwality Dairy.

Prabhat Dairy has only recently commissioned its cheese plant production. Since cheese requires aging of 60-90 days, it will continue to see increase in working capital. We believe that its strategy to expand sales in tier 2/3 towns will help in the medium term by helping improve margins and reducing working capital. However, in the short term, increasing distribution reach will entail higher expenses and investments into the trade channel, which will strain margins and cash flows.

Parag Milk Foods: Innovating its way out

A few years ago, modern trade was suddenly flooded by a brand called 'Go Cheese', which most people thought was an international brand. The quality of product met international standards and soon people in investment circles started enquiring about the relatively inconspicuous dairy company "Parag Milk Foods," which owns the Go Cheese brand. Armed with private equity funding from Motilal Oswal in 2008 and a vision of building a dairy company capable of churning out international quality products, Parag Milk Foods has one of the most promising narratives in the Indian dairy industry.

Pune-based Parag Milk Foods, founded in 1992, is one of the largest private dairies in Maharashtra with a distribution network spread across various states in the country. It has an

aggregate milk processing capacity of 2mn litres per day and two manufacturing plants in Maharashtra and Andhra Pradesh. It also has the largest cheese plant in India with a production capacity of 40 tonnes per day and produces base milk and value-added products.

Innovations galore

With a focus on product differentiation, Parag has one of the largest portfolios of products in the dairy sector. The company produces various types of cheese including mozzarella, shredded, and cheddar, each in a variety of flavours. For example, its cheese wedges are available in four flavours – black pepper, tomato salsa, Mexican twist, and plain. The company also produces flavoured yoghurt (eight different flavours), buttermilk in (two flavours), liquid milk (three variants), flavoured milk (six flavours). The company has a very strong distribution system with presence across 13 states with 3000 distributors. Currently, its retail sales comprise 80% of the portfolio. Major institutional clients include leading restaurant and café chains such as Pizza Hut, Dominos, KFC, and others.

Taking pride in premiumisation

"Our average yield per cow is around 22 litres, but our high-

est yielding cow gives a whopping 52 litres of milk a day. Mr Shah has nicknamed her Aishvarya," says the dairy guide at Bhagyalaxmi Dairy Farm. Spread over 35 acres, Bhagyalaxmi dairy farm houses 2,500 cows and is equipped with one of India's first rotary parlours, which has mechanised the whole milking process. The dairy farm markets its fresh milk under the brand Pride of Cows, which is based on the concept of fresh farm milk delivered directly to home within hours of milking. The farm at Manchar, Pune, has one of the highest yielding breed of cows of the Dutch Holstein Friesian breed, which is known for quality and high yield of milk of ~23 litres/day (6x the Indian counterparts). The cows are kept in a happy, stress free, free-range environment, and on a healthy regimented diet, which is conducive for milk production of

the highest quality. The cows are milked three times a day using milking machines. Using automation, the milk is instantly pasteurized, chilled, and packaged in bottles in less than three hours, and sent immediately for dispatch. The company currently distributes around 15,000 litres per day in Mumbai and Pune, and has the capacity of

25,000 litres per day.

Initially, the distribution started for product savvy consumers of south Mumbai, but as word of mouth spread and more and more people started enquiring about the brand, the company expanded its distribution. Now Pride of Cows reaches almost the whole of Mumbai and Pune. The branding and marketing is based on interesting concept of dairy tourism, where people are encouraged to visit the farm themselves to get a first-hand feel of the product. While the farm is managing to sell around 60% of its capacity in retail, if the model succeeds, it could be one of the most promising ones in the long-term and could become a benchmark for premiumisation.

Picking up steam

Over the years, Parag Milk Foods has developed a supply

Automatic cow milking at Bhagyalaxmi dairy farm

chain network in over 3400 villages in Maharashtra and south India. The company also has a higher bargaining power compared to its suppliers, which is evident from its payable days (highest among peers). The free cash flow from 2011-14 was negative (in line with the rest of the industry). However, higher payables and reduction in capital investment helped turn the free cash flow positive in 2015. The lower capacity utilization for Parag

Foods currently indicates that peak of cyclical capex is already done and free cash flow should be strong for the next few years. The company will continue to gain share in retail due to strong distribution chain and innovations. Parag Milk Foods will be among the few successful private players in the medium to long term and the oncoming IPO of the company will sail through smoothly.

Conclusion

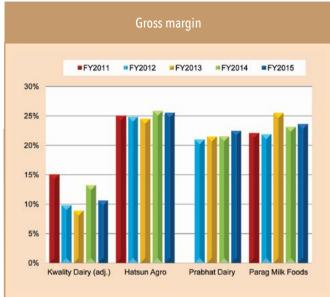

The Indian dairy industry is immensely complex and it is certainly not for the faint-hearted. Co-operatives will continue to dominate because of their traditional strength in milk sourcing. Consolidation of district milk brands in states such as Maharashtra (that has multiple district union brands) will help to further cement their dominance. However, the ability of co-operatives to invest and deliver quality products will remain constrained because of lower margins and negligible profitability. The biggest opportunity for private players is in premiumisation. The evolution of private players in the Indian dairy industry will depend on two factors - (1) their ability to increase retail presence and (2) their ability to invest in high-quality infrastructure, including supply chain. Both factors are long gestational. Retail presence depends on building brands through selling liquid milk while returns on large-scale investments are constrained by the margin profile of products.

Companies such as Hatsun Agro and Parag Milk Foods have the most promising business models because of strong retail presence and vision for value-added products. Hatsun has a strong portfolio in liquid milk, which will help it to expand profitably. Because of its strong presence in retail segments of ghee, cheese, and buttermilk, Parag Milk Foods will continue to outperform its peers. Due to strong competition in value-added milk products, other players such as Prabhat Dairy and Kwality Dairy will have to increase their retail presence by focussing more on liquid milk in core geographies, and then expanding into nearby geographies gradually. The focus on liquid milk will also help emerging players develop strong sustainable sourcing models that are necessary to establish a strong brand. Apart from the pure dairy players, other FMCG players such as Britannia have ambitious dairy-business plans. The case for developing a scalable business model is yet to be proven. However, in the case of brand extensions a lot depends on product saliency. With product innovations like dairy whitener (ahead of market when launched) Nestle has proven itself while others are still grappling with this aspect. Most players still have me-too portfolios and a highly innovative offering has been elusive. So, the wait continues.

FOCUS CHARTS

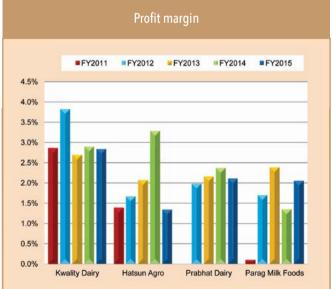

Sales have increased for all key players over the years

Except Kwality Dairy which sells more of low margin products, others have gross margins in range of 20-25%. Margins have not improved or fallen in last two years because of fall in prices of global commodities like skimmed milk powder

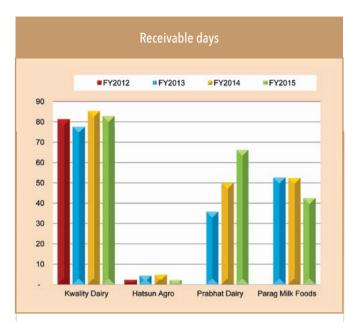

EBITDA margins are lower for dairy industry as a whole because of higher operating expenses

Dairy industry profit margins are lower than those of FMCG peers because dairy requires higher capital expenditure and higher working capital

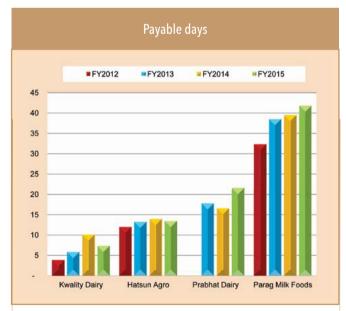

Source: Company, PhillipCapital India Research Estimates

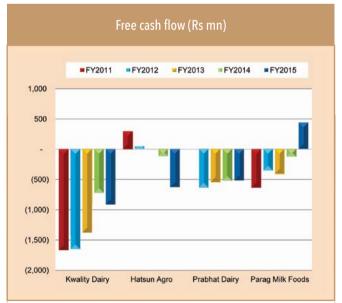

Except Hatsun Agro which has major portion of sales portfolio in retail, others have very high recievable days

Parag milk foods has high inventory days due to higher share of cheese in sales (cheese requires 3-6 months aging)

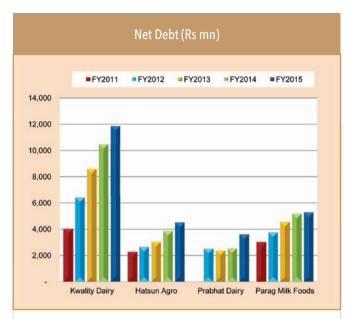

Parag Milk Foods has the highest bargaining power with suppliers

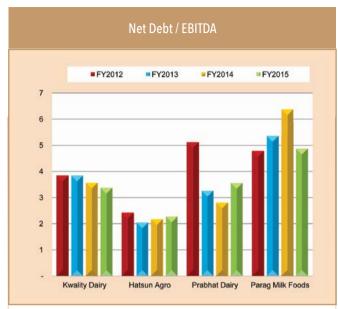

Most worrisome aspect of dairy industry is that free cash flow has been negative for most companies for most years because of high capital investment

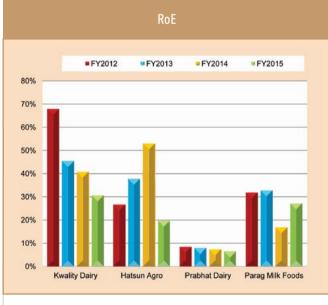

Source: Company, PhillipCapital India Research Estimates

Net debt and net debt/EBITDA for all four companies is very high

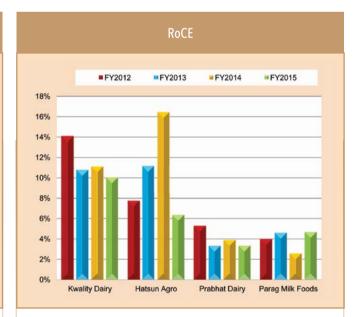

Net debt and net debt/EBITDA for all four companies is very high

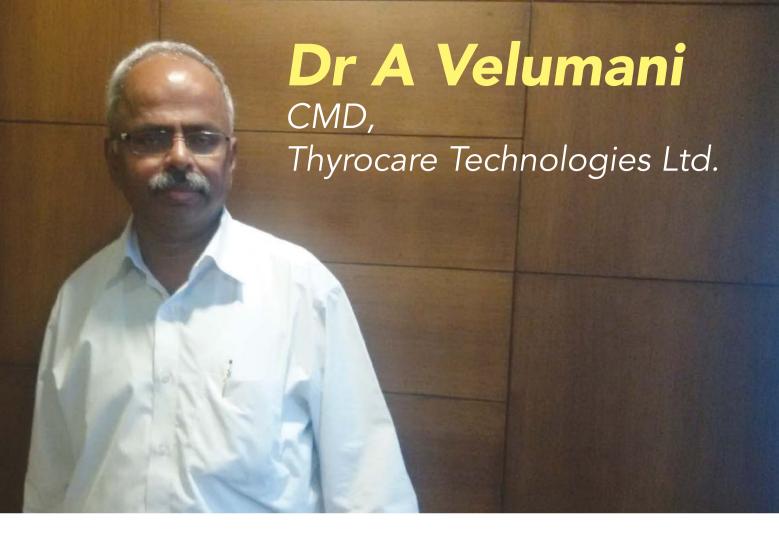

Most companies have seen continuous deterioration of RoE

Source: Company, PhillipCapital India Research Estimates

RoCE for dairy industry is poor because of high investment required

The Indian diagnostic market is set for robust annual growth of 20-25% over the next 20 years led by the rising age of the demographic, says Dr A Velumani, CMD – Thyrocare Technologies Ltd. He has revolutionised the Indian diagnostic industry with Thyrocare's focus on preventive care (vs. competitions' focus on sick care) and high profitability, despite disruptive pricing practice. Ground View spoke to Dr Velumani, to get an idea about the growth outlook and pricing scenario. Here are the excerpts from the interview

BY SURYA PATRA

What are the ground realities for the diagnostics market and how are they different from perception? Could you juxtapose this with 'known' facts such as size (~US\$ 6bn), annualised growth of 15-20%, and transition to regulated play?

A market size of ~US\$ 6.5bn for the Indian diagnostic market is grossly under-reported – this is because our country lacks any system of documentation for diagnostic or healthcare services, which is largely catered by the unorganised sector. Similarly, reported growth of 15-20% seems low, considering that India's demographic is shifting towards a higher age from a predominantly younger one.

Ground realities of the Indian diagnostic services industry indicate accelerated growth. While the annual per capita spend in the US on diagnostics is around US\$100, it is >US\$6 in India, implying significant scope for growth led by increasing income levels. India is still a young country with average age of around 25 years – and the need for diagnostic services grows with age. So, as India's demographic begins to move towards a higher age, its diagnostic market is set for 20-25% growth over the next 20 years.

While the industry saw steady progress, its profitability seems to be under pressure. What drives that and how does one handle it?

Profit margins for diagnostics in India are certainly challenged due to the market's nature. In the western world, this business is driven by hospitals while in India, it is driven by individual doctors. Since doctors drive healthcare/diagnostic, standalone laboratories become vital and such laboratories are non-accredited. These unorganised laboratories hurt the profitability of organised players. Even so, the scope of volume expansion in diagnostics services in India is enormous. Some efficiency in operations can weed out all margin pressure. All in all, I feel the unorganised market is not a big concern for organised players.

Do you see incremental competition from MNCs due to 100% FDI in diagnostics?

Healthcare and diagnostics are largely local subjects

and domestic players understand the needs well and cater accordingly. No MNC can pose a threat to local diagnostic players. Few MNCs have tried their luck in India over the last two decades, but failed. Quest is the only MNC in India with some respectable presence. About FDI, I do not think that the Indian diagnostic industry requires it since this is not a very capital-intensive business, unlike hospitals.

On pricing power, which factors according to you will have an impact on diagnostic services? How do you see the pricing per test unfold over the next 4-5 years?

Pricing of diagnostic tests will definitely fall, but this is unlikely to hurt profitability. Why should prices go down? Not because of competition – rather, this correction would be led by tremendous expansion of volumes and consolidation.

There are about 500 different types of tests in diagnostics and prices for about 50 have already fallen to optimal levels, but many players arrive at the pricing of most other tests after considering their patient pool (usually rich and upper middle class). There is robust scope for volume expansion in the lower middle class population and this will drive down prices.

Do you believe that a price-disruptive strategy is the key to success in the context of the Indian diagnostic market?

Yes, I still emphasise the fact that volume-led benefits in the Indian diagnostics are enormous, as organised players still account for only about 15-20% of the total reported diagnostic market, which is grossly under reported.

Thyrocare already earns a margin of around 44% and I can dilute this a bit to enhance market penetration, hence growth momentum, and ultimate profitability.

What has been Thyrocare's performance YTD and what is your outlook going ahead?

In FY15, Thyrocare saw 20% revenue growth to Rs 1.8bn with an EBITDA of Rs 736mn (implying a margin of ~41%) and a PAT of Rs 458mn. We are closing FY16 with sales growth of around 28-30%. Over last

three year, we have seen 20% CAGR and we are confident about similar growth over the next three.

The key to our success has been a price disruptive strategy with a focus on volume, and of course our differentiated business approach to tap preventive care diagnostic market compared to the competition's focus on sick-care diagnostic services.

What progress are you seeing for your cancer diagnostic operation under Nueclear Healthcare?

Thyrocare's 100% subsidiary – Nueclear Healthcare – focuses on PET-CT test (used to detect cancer). The objective of the subsidiary is to address the huge unmet need in cancer care and to offer affordable PET-CT tests. Believing 'scale/volume' is the only principle for success. Thyrocare offers PET scan at Rs 9,999 per test against competitors' prices of Rs 20,000-25,000. With such pricing, we have already initiated a disruptive pricing game in cancer diagnostics, but in India, volume is still too low for impactful disruption. Therefore, we are a bit slow on this business front.

The IPO of Dr Lal Path Lab in December 2015 was a great success. Could you tell us about your listing aspirations and timeline?

SEBI has already cleared Thyrocare's DRHP and we are likely to file our RHP before the end of March 2016 – our issue would be open for subscription by mid April 2016.

About Thyrocare

Thyrocare is one of the leading pan-India diagnostic chains and offers 192 tests and 54 profiles of tests to detect health disorders – such as thyroid, growth, metabolism, auto-immunity, diabetes, anaemia, cardiovascular, infertility and various infectious diseases. It profiles of tests are administered under the brand name 'Aarogyam'.

It has been operating from its central processing laboratories in Navi Mumbai and setup four regional centres in New Delhi, Coimbatore, Hyderabad, and Kolkata in 2014. As a result, Thyrocare's daily average test volumes jumped 37% (to 131,073 in FY15 (from 95,610 FY14) and by 26% to 165,672 until September 2015. However, the diagnostic services offered at the regional processing labs primarily constitute routine tests.

Through its subsidiary NHL's network of molecular imaging centers (in Mumbai, New Delhi and Hyderabad), Thyrocare offers PET-CT scan services to assist in cancer diagnosis, staging, monitoring of treatment, and efficacy and evaluation of disease recurrence. On a low base, PET-CT scan volume has jumped 5-fold to 11,173 scans in FY15.

Financial Health

As per the annualised H1FY16 performance, Thyrocare is likely to report 30% growth in consolidated sales (to Rs 2.38bn) in FY16 with EBITDA margins of 44%, which are the highest in the industry. Its annualised PAT of Rs 600mn implies a PAT margin of 25%. Thyrocare is a debt-free company.

Proposed IPO: At the end of February 2016, the Securities and Exchange Board of India approved Thyrocare's draft initial public offering (IPO) proposal of 10.7mn shares. Thyrocare's IPO is an offer for sale by private equity investor CX Partners and the firm's promoters. CX Partners holds 21% stake in the company, of which it plans to sell almost 90% in the public issue. Other PE investors in the company include Norwest Venture Partners (9.43%) and Samara Capital (2%), who are not selling their stakes in the IPO. The promoter's holding will dilute to 63.96% (from 64.96%) after the IPO.

Indian Economy – Trend Indicators

"VIEWS FROM THE GROUND"

Disclosures and Disclaimers

PhillipCapital (India) Pvt. Ltd. has three independent equity research groups: Institutional Equities, Institutional Equity Derivatives and Private Client Group. This report has been prepared by Institutional Equities Group. The views and opinions expressed in this document may or may not match or may be contrary at times with the views, estimates, rating, target price of the other equity research groups of PhillipCapital (India) Pvt. Ltd.

This report is issued by PhillipCapital (India) Pvt. Ltd. which is regulated by SEBI. PhillipCapital (India) Pvt. Ltd. is a subsidiary of Phillip (Mauritius) Pvt. Ltd. References to "PCIPL" in this report shall mean PhillipCapital (India) Pvt. Ltd unless otherwise stated. This report is prepared and distributed by PCIPL for information purposes only and neither the information contained herein nor any opinion expressed should be construed or deemed to be construed as solicitation or as offering advice for the purposes of the purchase or sale of any security, investment or derivatives. The information and opinions contained in the Report were considered by PCIPL to be valid when published. The report also contains information provided to PCIPL by third parties. The source of such information will usually be disclosed in the report. Whilst PCIPL has taken all reasonable steps to ensure that this information is correct, PCIPL does not offer any warranty as to the accuracy or completeness of such information. Any person placing reliance on the report to undertake trading does so entirely at his or her own risk and PCIPL does not accept any liability as a result. Securities and Derivatives markets may be subject to rapid and unexpected price movements and past performance is not necessarily an indication to future performance.

This report does not have regard to the specific investment objectives, financial situation and the particular needs of any specific person who may receive this report. Investors must undertake independent analysis with their own legal, tax and financial advisors and reach their own regarding the appropriateness of investing in any securities or investment strategies discussed or recommended in this report and should understand that statements regarding future prospects may not be realized. In no circumstances it be used or considered as an offer to sell or a solicitation of any offer to buy or sell the Securities mentioned in it. The information contained in the research reports may have been taken from trade and statistical services and other sources, which we believe are reliable. PhillipCapital (India) Pvt. Ltd. or any of its group/ associate/affiliate companies do not quarantee that such information is accurate or complete and it should not be relied upon as such. Any opinions expressed reflect judgments at this date and are subject to change without notice

Important: These disclosures and disclaimers must be read in conjunction with the research report of which it forms part. Receipt and use of the research report is subject to all aspects of these disclosures and disclaimers. Additional information about the issuers and securities discussed in this research report is available on request.
