LETTER FROM THE MANAGING DIRECTOR

The Indian IT sector has come a long way from the traditional cost-arbitrage model that it once operated on. While there has been gradual progress on the quality of work being outsourced to Indian companies, bigger in roads have been created in engineering. Indian IT companies are now engaged with the who's who of global engineering companies and helping them with their research and development work.

With Engineering Services Outsourcing (ESO) emerging as the next big wave for Indian IT companies, apart from the SMAC revolution, we publish our cover story on the Engineering R&D domain and its potential for Indian IT companies. The story "Engineering R&D: The World at India's doors", penned by our IT services analyst, Vibhor Singhal, is an interesting analysis of the evolution of the ESO model, the challenges the segment faces, and the potential opportunity in this space. With the new government's 'Make in India' initiative set to provide a huge impetus to the segment, ERD is surely the space to watch.

We have also interviewed Mr D K Vyas, CEO of Srei BNP Paribas, one of India's largest construction- and mining-equipment financiers with an AUM of around Rs 190bn. We spoke to him about the current situation of the industry and emerging trends in the sector.

Best Wishes

Vineet

ENGINEERING THE WORLD AT INDIA'S R&D: DOOR

Across sectors, R&D has always been treated with the utmost confidentiality and hence, there has never been scope for any form of collaboration in this field. However, shrinking R&D budgets, reducing time-to-market, and the rapidly evolving technological landscape has forced many companies to consider outsourcing as an option. Due to the changing mindset, the quality of the work being outsourced has evolved significantly. With the largest pool of engineers at their disposal, Indian IT companies (captives and third-party) have a mammoth opportunity before them. Let's read further to find out how the sector has evolved and what challenges and opportunities lie in store...

Indian IT companies: The supply advantage

BY VIBHOR SINGHAL & DEEPAN KAPADIA

The global landscape

Engineering research and development (ERD) has emerged as the next-gen domain for the Indian IT industry. In this domain, Indian IT companies have seen robust growth over the last five years (15% CAGR); more importantly, the quality of the work being outsourced to the Indian companies has evolved significantly—to innovation and development-driven high-end projects from cost-arbitrage driven low-end tasks. Having extensively tapped BFSI and manufacturing across US and Europe through the wide palette of service lines such as ADM, IMS, and BPO, Indian IT companies are now looking at the huge potential in the ERD domain.

Engineering Research & Development – as the name suggests, involves research and development in various engineering domains. The segment is primarily related to sectors that involve high-end engineering capabilities such as automotive, aerospace, telecom, electronics, and medical devices. Companies in these sectors spend huge amounts of resources to continuously develop new products or product enhancements.

In FY14, global ERD spend grew by ~3% to US\$ 1.44tn. Automotive and consumer electronics sectors accounted for over 25% of this spend—automotive driven by safety and emission-efficiency requirements and consumer electronics driven by increasing demand for new products and interfaces. US and Europe continued to account for over 2/3rd of this spend with Asia (excluding Japan) constituting 10% and growing fast.

Sectors

Among sectors, automotive, aerospace, electronics, and medical devices are expected to see continued high levels of investment in engineering R&D. Key drivers of higher ERD spends in these sectors are:

Automotive: Regulatory compliance, green energy, enhanced customer experience, energy efficiency, higher electronics content.

Aerospace: Innovation in product design, green energy.

Medical devices: Regulatory compliance, innovation in product design, enhanced customer experience.

Consumer electronics: Innovation in product design, enhanced customer experience, digitization.

Regions

Amongst geographies, US continues to spearhead the global investment in ERD, accounting for over 35% of the global spend, followed by Europe, Japan, and China.

Companies

In FY14, Volkswagen stood out as the highest spender on R&D at US\$ 13.5bn. Samsung, Intel, Microsoft, and Roche fill up the remaining spots in the top-5. Among the top-20 R&D spenders across the globe, 10 belonged to the manufacturing sector (primarily automotive and electronics), seven were from healthcare, and three were from software. Geographically, the US and Europe accounted for 15 of the top-20 R&D spenders (eight and seven respectively) while four companies from Japan figured on the list.

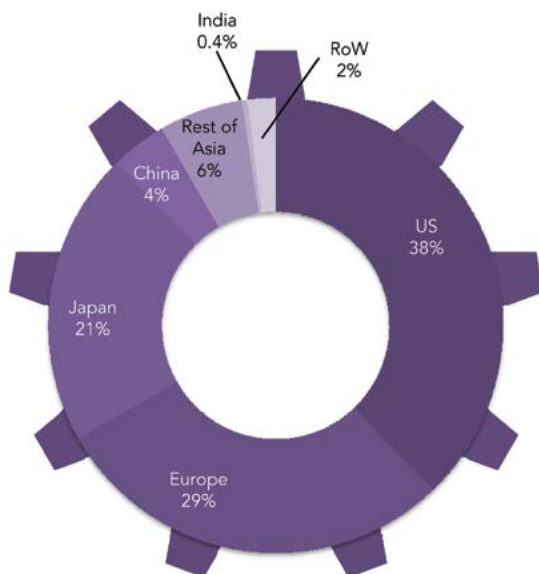

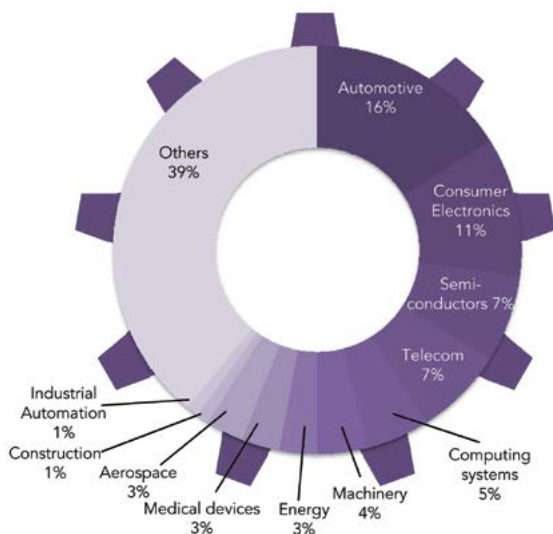

Focusing on ERD expenditure, the following companies claim the top-5 spots in their respective segments:

Top spenders on R&D across the globe

Automotive	Aerospace	Electronics	Medical Devices	Core manufacturing
Volkswagen	Boeing	Samsung	J&J	Caterpillar
Toyota	EADS	Intel	GE	Cummins
GM	Lockheed Martin	Nokia	Medtronic	Komatsu
Honda	General Dynamics	Panasonic	Siemens	Mitsubishi
Damler	Dassault Aviation	Sony	Baxter	ABB

Company	ERD spend (US\$ bn)	ERD spend as % of sales	Country	Sector
Volkswagen	13.5	2.5%	Germany	Manufacturing
Samsung	13.4	6.4%	South Korea	Manufacturing
Intel	10.6	20.1%	US	Manufacturing
Microsoft	10.4	13.4%	US	Software
Roche	10.0	19.0%	Swiss	Pharma
Novartis	9.9	16.8%	Swiss	Pharma
Toyota	9.1	3.5%	Japan	Manufacturing
J&J	8.2	11.5%	US	Pharma
Google	8.0	13.2%	US	Software
Merck	7.5	17.0%	US	Pharma

Break-up of global R&D spend

India's position

As per NASSCOM's estimates, the Indian ESO market stood at US\$ 19bn in FY15, an addition of US\$ 2.2bn over FY14's market size. The country holds the second position in the ERD global sourcing market (US\$ 80bn) with 25% market share trailing China.

The Indian ESO market

Computer Hardware and Storage

US, China, Japan and Korea are the fastest growing markets in this domain. The market is expected to be \$220bn+ by 2020

Medical Devices

One of the fastest growing market globally - primarily due to increased govt spend on healthcare (in US and Europe) and increased instances of lifestyle diseases

Aerospace

Europe remains the leading market - esp France. By 2030, regions other than US and Europe are expected to own more than half the commercial aircrafts in service

Consumer Electronics

Dominated by US and China - the market is expected to reach \$1.3 trillion by 2020. Japan and South Korea are also sizeable markets in this domain

Automotive

While sales in Europe have been muted, US and China have been growing at significant pace. The market is also expected to witness higher expenditure in coming decade on the back of environmental norms and higher automation

Semiconductor

Asia continues to account for over 50% of the market, aided by Japan and South Korea - SE Asia will remain a dominant market

Telecom

India and China are fulfilling the growth prospects for the industry - which is facing decline in mature markets of US and Europe

Key Market Trends

Evolution of the ESO industry

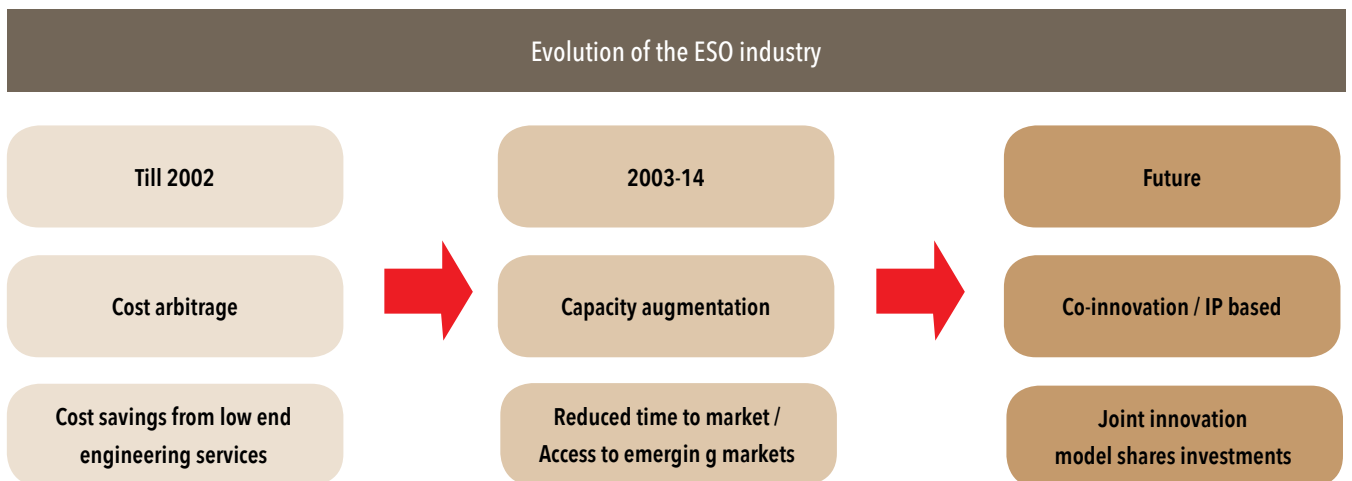

Traditionally, R&D has been perceived as intellectual property and a core activity. Outsourcing or partnering for R&D was considered a threat to the functioning of an organization. However, lately managements have been forced to consider outsourcing ERD due to global competition, reducing time-to-market for products, and cost pressures. This shift has led to a significant change in the ERD services portfolio, with greater emphasis on product engineering and innovation compared to staff augmentation. The focus is not on products alone, but also on the ecosystem of services around the product, including its geo-specific variants and associated platforms.

The evolution of the Indian ERD Outsourcing (ESO) industry can be broken down into three phases defined by the nature of work and the changing outsourcing business model.

Generation 1, until 2002—cost arbitrage: The first stage of ESO was largely based on cost arbitrage. Original Equipment Manufacturers (OEMs) and Independent Software Vendors (ISVs) leveraged Engineering Service Providers (ESPs) for engineering support by using staff-augmen-

tation models. ESPs were able to provide scale, whenever and wherever required, with abundant talent pool across the globe. Project execution was limited to basic activities such as scanning and digitizing of engineering drawings to engineering change order management. Product engineering was considered to be a core and IP-centric activity and therefore beyond the realms of outsourcing.

2003-2014—capacity augmentation: The second stage was the movement to capacity augmentation from pure cost arbitrage. The second stage can be broken down into two phases: (1) 2003-2010 and (2) 2010-2014. In the first phase, growth in ESP was driven by customers' need to reduce time-to-market, which the ESPs provided by use of relevant manpower and capacity augmentation. ESPs helped them to accelerate product development and provide scale on need basis. The second phase was largely to gain access to emerging markets, as these markets became important due to rising customer spends. However, project execution remained largely related to non-core product development and helping customize on-going designs for faster market launches. Partial product engineering was outsourced; but core R&D activity

and IP-centric were still off limits for outsourcing.

The future, 2014 onwards: The third stage is largely driven by globalization, reducing R&D spends, and product lifecycle pressures. Managements are focused on developing effective outsourcing strategies that drive significant improvement in global ERD operations. The ESO market has seen substantial growth and has evolved to encompass a broad range of new product development, value engineering, and product-support functions. Going ahead the growth of the ESO industry will be driven by product innovation capabilities and by how players collaborate with customers to share the risk-reward of R&D investments.

Levers for outsourcing R&D

There are four major motivations for outsourcing: efficiency, market, resource, and technology.

Efficiency factors: Outsourcing largely to improve efficiency in terms of cost and increase the management bandwidth to focus on core activities. With reducing budgets and R&D spends, companies are looking to expand their footprint in low-cost countries to leverage the cost differential in the engineering effort.

Market factors: Increase in per-capita income in emerging markets has resulted in increasing consumer spends. Also, phased launches across the globe are no longer considered

US corporate priorities and spending patterns for R&D/PE services: IDC survey, 2013

"It all started with GE taking the leap of faith in early 90s, and outsourcing part of their R&D work - other companies soon followed"

- A senior manager in one of the top-4 Indian IT companies, with over 17 years of experience in the ERD domain.

effective, as global/local competition can enter emerging markets quickly due to the shortening product lifecycles. Outsourcing has helped customers improve access to global markets with an ability to address emerging and adjacent markets simultaneously. It can also help companies meet temporary product development needs, without imposing a long-term commitment.

Resource factors: As the technological complexity of product engineering is increasing at a rapid pace, it is becoming increasingly difficult for ERD companies to get a flexible pool of engineers with the relevant capabilities and competencies. Outsourcing allows them to address technological and process innovations, when size and/or time constraints prevent them from establishing these capabilities in-house. Obtaining the necessary expertise and skills outside can help a company move ahead of its competitors.

Technology factors: The world is becoming more connected, with consumers expecting seamless experience across devices with advanced features and functionalities. OEMs and ISVs need to ensure that the product platform can integrate with an entire ecosystem of devices with different form factors and can be consumed in different manners (touch, voice, and video). All of this has increased the importance of embedded software as a means to merge the device with the application to provide a seamless experience.

Perceived barriers and threats

While the levers for outsourcing are fairly obvious, the customer's mind set towards outsourcing, especially R&D, remains fraught with barriers. The perceived barriers to R&D vary according to the clients' industry, size, and R&D

spends. The perception of barriers increases as R&D activities increase. The companies' need to guarantee proximity to clients is one of the main barriers for ERD sourcing. Overall, if the costs of the sourcing operation exceed benefits it is generally considered an important barrier.

Barrier 1: Fear of lack of control over product development

Most companies consider their product-development roadmap to be an important differentiator and do not show willingness to disclose details of their next-generation products and solutions for fear of leakage to competitors. This leads to fear of outsourcing work related to product development.

Barrier 2: Quality of outsourced work

Companies believe that outsourced work created by third-party vendors will not adhere to their quality standards. The belief comes from loss of complete control over labour and processes. There is a widespread perception that vendor employees are less loyal and have much lower incentive to produce good work at a reasonable pace.

Barrier 3: Geo-political reasons

Geo-political barriers arise out of diversity across countries and include cultural barriers, physical distance, time difference, and political instability.

Besides these, other major barriers are

- Legal or administrative barriers
- Taxation issues
- Trade tariffs
- Concerns about employees (including trade unions)
- Concerns surrounding violation of patents and/or Intellectual Property Rights
- Conflicting social values of companies
- Linguistic or cultural barriers
- Difficulties in identifying potential/suitable providers abroad and once identified, educating them (vendor development).

What can be outsourced?

ERD is currently in its early days of outsourcing (relatively) where customers are facing the same kind of questions that haunted those who chose to outsource functions such as CRM and ERP a while back. The key question is which function to outsource and which to retain in-house. It represents a classic dilemma for any industry, where the company tries to determine what its 'core' business functions are (critical to success, important to clients) and what are relatively 'non-core'. Once the company is able to resolve this dilemma, it just needs to map the delivery capability of the vendor—which is a function of the vendor's vertical expertise, global footprint, scale, and value proposition—and take the decision accordingly.

While the product development and lifecycles of various ERD verticals (aerospace, automotive, consumer electronics) differ significantly, functions that they can/cannot, or rather would/would not outsource are fairly similar.

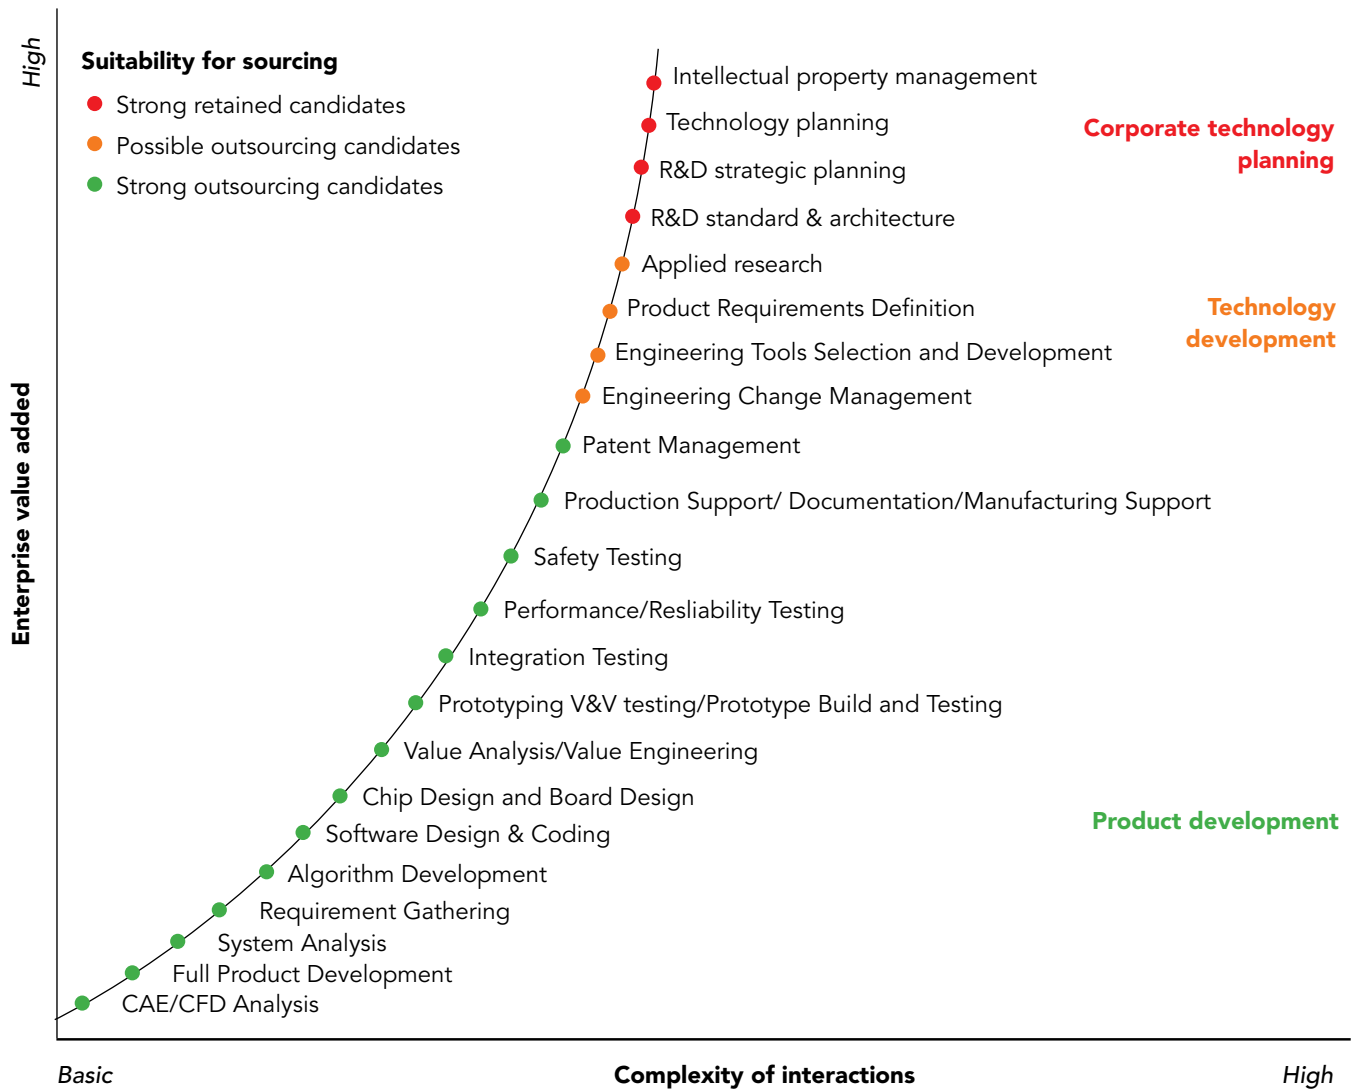

Over the last two decades, ESO vendors have established strong credentials in product lifecycle management (production support, integration testing, and software design) by building/investing in vertical domain knowledge and technical competencies. Because of these enhanced capabilities, the range of functions that are strong candidates for outsourcing in the product development stage has expanded significantly.

Building on the domain knowledge and technical expertise of the last two decades of work in the ERD space, these ESO

Source: HCL Tech

The outsourcing matrix

Source: ICG

vendors have expanded their value analysis/value engineering (VA/VE) proposition across all verticals, especially in the last five years. They now offer full services for computer-aided engineering/computational fluid dynamics (CAE/CFD) analysis, full product development, prototype build and testing, and manufacturing support across nearly half the industry verticals. Customers are increasingly outsourcing domains such as applied research, system analysis, and algorithm-development.

However, the outsourcing vendors still have a long way to go, before they can hit upon the most lucrative target of getting their customers to outsource corporate technology planning.

The domain would include R&D architecture and planning, IP management, and technology strategy.

It is interesting that outsourcing growth in mechanical and hardware product development has been half of the outsourcing growth in electronics, software, and embedded software product development. The main reason is that manufacturing (broadly) requires far more specific expertise in industry, domain, and products than electronics/software. Because of this, growth trajectory for outsourcing in the manufacturing vertical will always lag behind electronics and software.

Special section – The future of Engg services

Exclusive contribution by the Information Services Group (ISG)

Engineering Services Redefined – It's a new game.

Engineering services (ES) has been defined as services that are required across the lifecycle of a product, from its conceptualization to its retirement. Traditional product design and development, which is core to the engineering function, leveraged Information Technology through tools and databases and some automation of processes. Now IT is enveloping products and integrating more tightly with engineering. The change will impact not only how products are being made but also how enterprises will engage with engineering service providers.

India-based ES providers and delivery centers account for nearly a quarter of the overall engineering services market (outsourced or offshored), market that is worth approximately US \$80 billion annually. NASSCOM predicts that the engineering services revenue base in India will grow from \$18 billion in 2014 to \$30-38 billion in 2020, with a CAGR of 12-13 percent, a growth rate greater than the overall IT-BPM industry. With this growth, we believe, the virtual oligopoly enjoyed by a dozen plus India-based service providers is expected to break up as the new service delivery and pricing models evolve.

Engineering Services as it exists today

Seen as an extension of an enterprise's engineering organization, outsourced engineering services have convention-

ally been less intense than IT Applications, IT infrastructure or BPO. ES have been traditionally delivered through time-and-material contracts of short project durations (12-18 months) and restricted to relatively small groups of service providers based in India, China, parts of Europe and a few others.

In 2014, the Indian ES industry was worth about \$18 billion. It could be divided into Global Engineering Centers (GECs) and the Engineering Service Providers (ESPs). The GECs constituting about 55 percent of Indian the ES industry are extension of Engineering and R&D arm of parent organizations, many of which are global technology giants. As per estimates, over half of the top global 500 R&D spenders operate in India through these GECs.

The other 45 percent of the industry revenues come from the 25 odd ES providers that make up large or medium-sized Indian IT companies, medium or small-sized ES-focused Indian firms (many of which are backed by Private Equities) and offshore delivery centers of global IT companies.

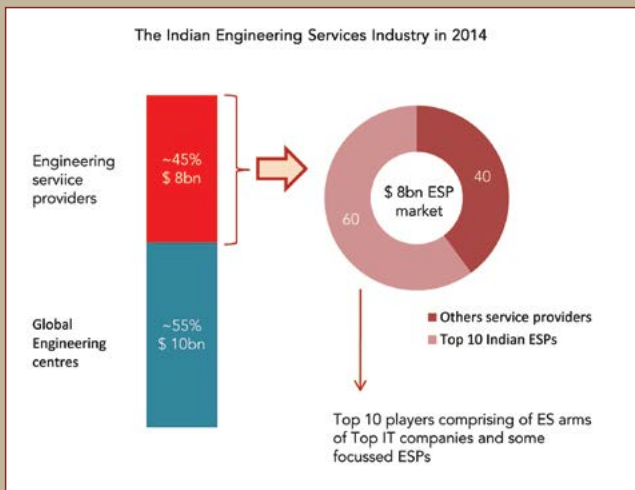

The Change and the drivers behind it

In the next five years, we will see some significant changes in the way Engineering Services is delivered:

Information technology and electronics are permeating the product engineering process, reshaping the way engineering service is being demanded and consumed. The top three drivers for change are

- Embedded software is adding intelligence to the product
- Internet enablement in products and services is requiring a direct interface between engineering and IT
- IT-enabled and engineered products are intersecting with manufacturing constructs, like the 3D printing

The Second wave: The Internet of Everything is disrupting engineering services delivery: The advancement in sensor technology, wireless communications, distributed computing and big data capabilities are enabling the Internet of Things (IoT) to rapidly transform the technol-

Changing landscape of the engineering services industry

Parameter	AS IS - 2015	TO BE - 2020
Offshore-Onsite delivery	Offshore: 80%; Onsite: 20%	Offshore: 60%; Onsite: 40%
Business Model	T&M/Staff Augmentation: 70% Fixed/Outcome based, others: 30%	T&M/Staff Augmentation: 50% Fixed, Outcome based, Risk-Reward: 50%
Key Drivers	Cost, Scale and Skills	Operational excellence and Innovation

ogy landscape. Information Technology is permeating products and services and creating a profusion of data and devices. This is creating unique opportunities to create intelligent engineering applications to customize, monitor, consume and engage the entire product experience.

Every company is now a software company: Across industries, software is the new interface for usability of products and services. Software plays a crucial role in acquisition, retention and satisfaction of end-users today. The ability of a product to capture its own usage data and establish a continuous feedback loop to its engineers and designers is leading to agility in product development and quicker development cycles.

Increasing intelligence in products is transforming traditional products into services

Furthermore, OEMs are increasingly moving to deliver their products 'as-a-service' and using software applications to define the customer experience. These trends have spawned huge demand for software engineering around newer and more engaging digital applications. As these trends emerge and the new coalition between IT in Engineering becomes more widely known, the field will

experience aggressive growth, delivering on the NASSCOMs predictions.

The Third Wave: The Integration of IT, Engineering and Manufacturing will become the next BIG thing

As technology evolves, manufacturing is becoming an integrated part of the mix, creating the third-more pronounced wave of change. Initiatives such as Industry 4.0 in Europe and the Industrial Internet in North America are enabling the creation of the 'digital shop floor'. We expect this to happen in two phases:

Phase 1 – Evolution of the digital shop floor: This includes the integration of previously silo information systems in an enterprise like the Enterprise Resource Planning (ERP), Product Life-cycle Management (PLM), and Manufacturing Execution Systems (MES) among others. Such integration will increase productivity, optimize operational costs, enhance equipment utility, improve safety for employees and lessen environmental implications. Equipped with the right tools, skills, and key partnerships, ES providers are expected to play a key role in this development.

Phase 2 – Extending Fabless techniques to discrete manufacturing : The second phase will be based on more

Waves propelling the engineering service industry

	Technology Shift	Industry Examples
Wave 1, 2000-2010	Embedded software in the product and product ecosystem	- Auto manufacturing – telematics and infotainment - Healthcare – medical devices and implants - Consumer electronics – embedded intelligence in white goods
Wave 2, 2010-2017	IoT/M2M adoption and Digital transformation. (IT envelops the product)	- Auto – V2V, V2I, driver assistance - Smart homes - connected home appliances - Healthcare- remote and continuous monitoring - Engineering information management
Wave 3, 2015 onwards	Integrating manufacturing with engineering and IT systems; and 3-D or Additive Printing (IoT evolution)	- Smart manufacturing - PLM-MES-ERP integration - Digital oil fields – integrated and optimized - 3-D and additive printing application

Key IoT application across Industries

Automotive	Connected car, advanced driver assistance Vehicle to Vehicle (V2V) and Vehicle to Infrastructure (V2I) communication
Energy/Utility	Smart Grid, smart buildings/energy consumption, proactive maintenance of production critical & expensive equipment
Healthcare	Remote monitoring, real-time & continuous clinical care, wearable devices, early interventions

disruptive concepts like additive manufacturing or 3-D manufacturing. As 3D printing becomes more widely applied, there will be immense opportunity to leverage it for economic growth. The 'design-to-print' concept will impact the maintenance and repair requirements and dramatically cut manufacturing costs and time.

Imagine a washing machine that can suggest the replacement of a spare part through a smart platform. The communication sent to the local vendor triggers a real-time spare part printing in a fraction of the time and cost required to otherwise source from a remote warehouse. Or consider 24x7 monitoring of the production of critical and expensive infrastructure equipment in which a predictive maintenance system generates a request to trigger a real-time 3-D printed replacement, minimizing productivity loss and cost. The 3-D printing concept is more operational than most people believe. Today, the hearing-aid industry is based on the simple but powerful application of 3-D printing.

But to ride the wave, ES delivery models need to change

To realize the full potential of these growth opportunities, engineering services delivery model needs to change.

Global Engineering Centers that are currently entirely focused on engineering products will need to address the challenges of IT-enabled engineering by broadening their scope and enhancing their investments in new processes and technology. They will need to create integrated service models that add measurable value and innovation to the parent enterprise. GECs must also leverage the higher level of experience, exposure and investments of ES providers in a

collaborative model.

Managed services contracts for ES providers will need to move away from the traditional engagement models to modify current thinking and demand more value and tighter service integration. This will include a combination of pricing aligned to the customer's business metrics, rigorous service level agreements and contractual operational efficiency and/or innovation. We see the business model slowly shifting to one with greater sharing of risk and reward between the customer and the service provider, transforming the role of the latter to a more strategic engineering partner than a mere vendor supplying engineering services.

So what's the point?

As service delivery evolves, we will see two important points:

- Enhancing the value of Global Engineering Centers in enterprises will result in
 - ✓ Stronger leverage of the centers through an integrated service delivery model
 - ✓ A more trusting and nurturing relationship with the service providers
 - ✓ A measurable and benchmarked value proposition to the enterprise
- Engineering Services will evolve to reflect more skin in the game for the service providers, much larger engagement portfolios and governance structure that enable innovation and topline & bottom line growth for the customer.

The changing face of Engineering Services

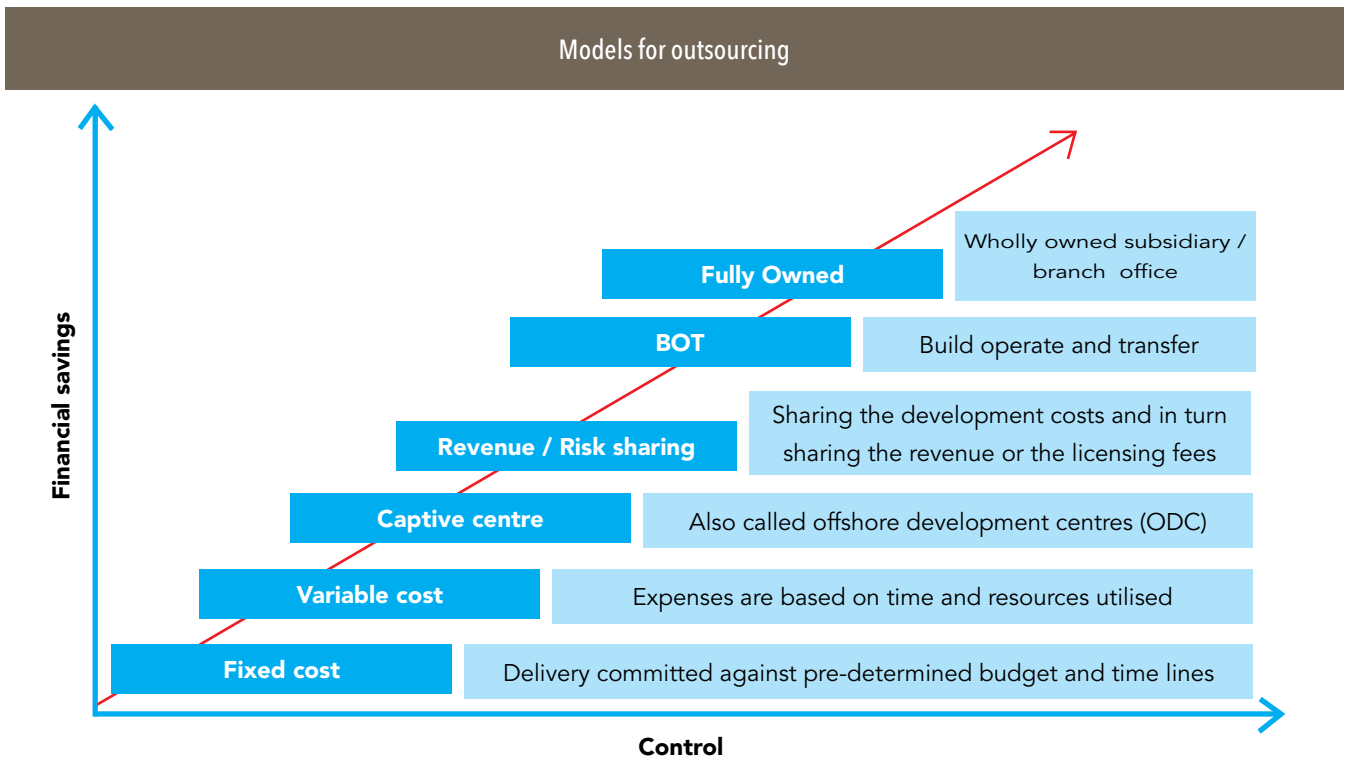

Models for outsourcing ERD

Typically, engineering services continue to be delivered primarily through hourly, daily, weekly, or monthly rates-based pricing models, staff augmentation relationships, or time and material (T&M) projects of various forms. These less-mature resource-based pricing models reflect the conservative nature of the client base; specifically, the lack of sourcing maturity within the engineering services community.

However, of late, buyers of engineering services are shifting towards more mature and advanced sourcing relationships that provide more predictable, stable, and higher quality of services and deliver the anticipated and contracted value to them. Chances of product success are higher if the service providers also have financial incentives to achieve business outcomes and hit target service levels and performance metrics.

Fixed cost outsourcing/subcontracting is one of the fastest methods and is best applicable for a short-term (project), when the outsourcing element is clearly a separate function—the two parties agree to a fixed cost that includes the vendor’s margins. The control of the project (budget, timelines, and quality) can be a challenge here. Also, the IPR issues need to be considered. This model requires constant information sharing. Companies usually start with this model and graduate to other models over a period.

Variable cost outsourcing is a contract where the work is paid by the actual working hours and resources used (the standard industry time-and-material format). Here the buyer gets a better picture of the actual costs and price levels than in the fixed cost model. Also, if the project is done in phases, the risks are generally lower, as it is possible to regularly follow the development of the work.

Captives With IP being one of the biggest concerns in the ERD space, many companies are using captives to simultaneously preserve control and exploit the benefits of outsourcing. On a large or long-term operation level, captives provide lower costs than prices charged by vendors. Recently, captives have been rapidly expanding their engineering capacities in India. With the Indian government encouraging FDI in setting up R&D facilities (captive R&D centres) many

multinationals have increased investments in R&D in projects. According to an Infosys study, about 70% of companies that have set up captives in India have done so through wholly owned subsidiaries. More innovative models, which involve a financial or operational partnership (e.g., JVs) with established Indian entities, are not widely popular. Negligible numbers have been created on a Build-Operate-and-Transfer model.

Difference between ESO and other IT service lines

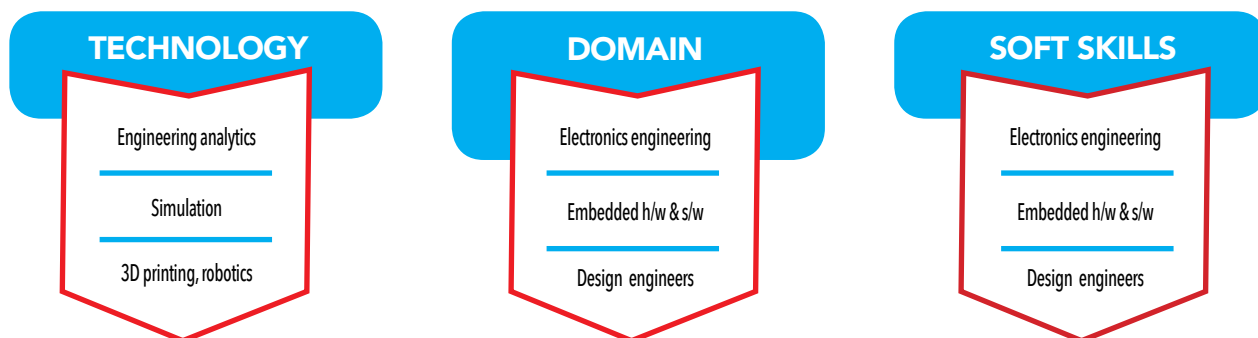

ERD is fundamentally completely different from other traditional service lines, which constitute the portfolio of IT-services companies. While traditional service lines such as ADM, enterprise application and IMS require little engineering background and training, ERD requires a high level of understanding of engineering concepts and principles. Also, the kind of training that is required for ERD service lines is

completely different from other domains—traditional service lines require a ‘developer’ to be trained in various coding languages and platforms (C++, Java, .net) while ERD requires ‘engineers’ to be trained on various CAD/design platforms (CATIA, SolidWorks, Pro/E). The deliverables are also completely different for traditional service lines and ERD.

Poles apart – ERD and other traditional IT service lines

Parameter	Traditional service lines	Engineering research and design
Educational/technical qualification of the 'developer'	Software developers	Engineers—preferably Mechanical/Electrical
Training to be imparted to the 'developer' before induction	Various software platforms like Java, .net, C++	Various engineering design platforms like CATIA, SolidWorks, Pro/E
Nature of project deliverable	Customized software solution, with post-delivery maintenance	Parts of the Product Life-cycle Management (PLM), that can be integrated with various such deliverables from across the globe
Failure risk	Medium - Problems in the deliverable can be fixed in post-delivery maintenance period	High - Problems in deliverable can lead to faulty product design for the client; can lead to potential loss of client
Major verticals	BFSI, manufacturing, telecom - across the spectrum	Manufacturing - auto, aerospace, consumer electronics; health-care - medical devices
Project duration	Medium to long: varying from 2- 7 years (for IMS)	Short: Less than 12-18 months

Skills in demand for ERD services

Case Study – MRO: A mammoth opportunity

Maintenance, repair and overhaul (MRO) is a sector that involves overhaul, repair, inspection, and modification of an aircraft/automobile or its components to keep it operational. The global aircraft MRO market is estimated to be around US\$ 61bn (annual revenue) and is expected to see a CAGR of 3.8% over 2012-2020. India's current MRO market size is estimated to be around US\$ 1200mn and is expected to see 13% CAGR for the next five years to reach US\$ 2.2bn by 2020.

Line Maintenance:

- * Performed approx. every 100-150 flights hrs
- * Usually done overnight

Engine Overhaul:

- * Performed approx. every 12-18 months
- * After every 5000 hours

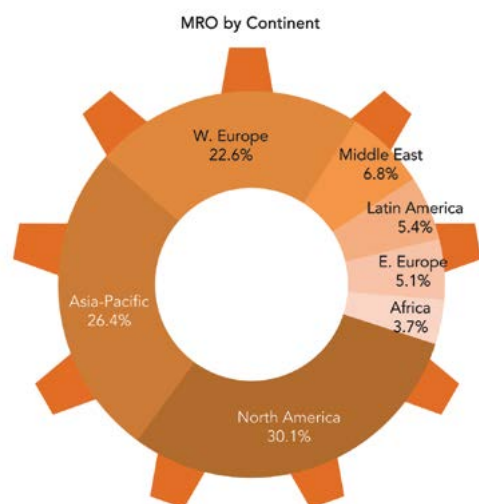

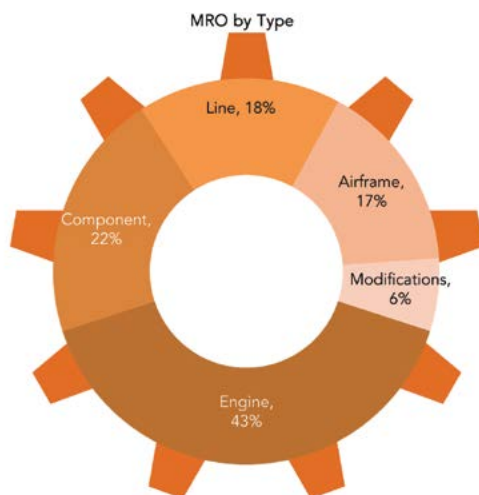

MRO market segment & type of MRO check

Airframe Heavy Maintenance & Modification:

- * Most comprehensive check
- * Approx. every 4-5 years

Component MRO:

- * Performed approx. every 3 months
- * Every 500-600 fit hours

Source: ICF International

Market segmentation for MRO

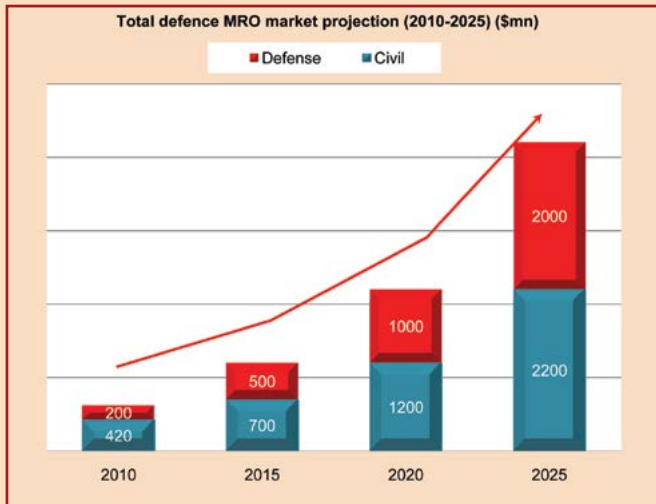

The market for the aircraft MRO sector is typically divided into four major segments, which include airframe heavy maintenance and modification, engine maintenance, line maintenance and component maintenance and modifications.

Estimated overall market size

The Indian MRO sector has the ability to absorb technology transfer at depot level for aircraft as well as components and has the potential of becoming the international hub for MRO needs. For a reputed MRO there is a huge market waiting to be tapped, especially considering that the engine, airframe, and MR blade & hubs facility is non-existent. Further, retro-fitting of essential components such as CVRs, FDRs, transponders, sand filters and even interiors is needed desperately.

Considering the increasing civil and defence spending on MRO every year, the total estimated market size of Indian MRO market in the next 15 years, which comprise of civil and defence spending (US\$ 28.9bn in civil MRO + US\$ 18.8bn in defence MRO) during the period from 2010-2025 is estimated to be around US\$ 47.7bn.

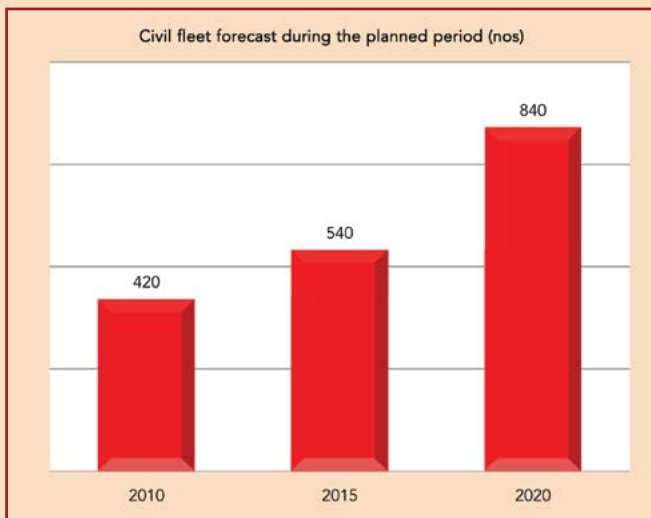

The opportunity also originates from the fact that location-wise there are no MROs facilities between West Asia and South East Asia, and India is strategically located for over-fly-

ing and transiting. In fact, there is no MRO hub within the 5 ½ hour fly zone over India.

Indian civil aircraft MRO market

The Indian civil aviation MRO market is at a nascent stage and at US\$ 700mn in annual revenues, it represents only 1% of the total global MRO market. However, Indian carriers are expected to double their fleet size by 2020 to 900-1000 aircrafts. The rapidly growing aircraft fleet, growth in domestic traffic, and the increasing age of Indian aircrafts will lead to significant growth in MRO activities in India in coming years. By 2025, the market is expected to grow to US\$ 4.2bn

(CAGR of 13.5%). However, this would also be a small fraction as compared to China (US\$ 2bn) and Singapore (US\$ 5bn).

Indian defence MRO market

The Indian defence MRO currently stands at US\$ 500mn in annual revenues – a paltry 0.5% of the total global MRO market. It is expected to grow to US\$ 2bn by FY25 (15% CAGR). India is poised to become a large defence aircraft market – as the necessity for military MRO capabilities increases with increase in military expenditures.

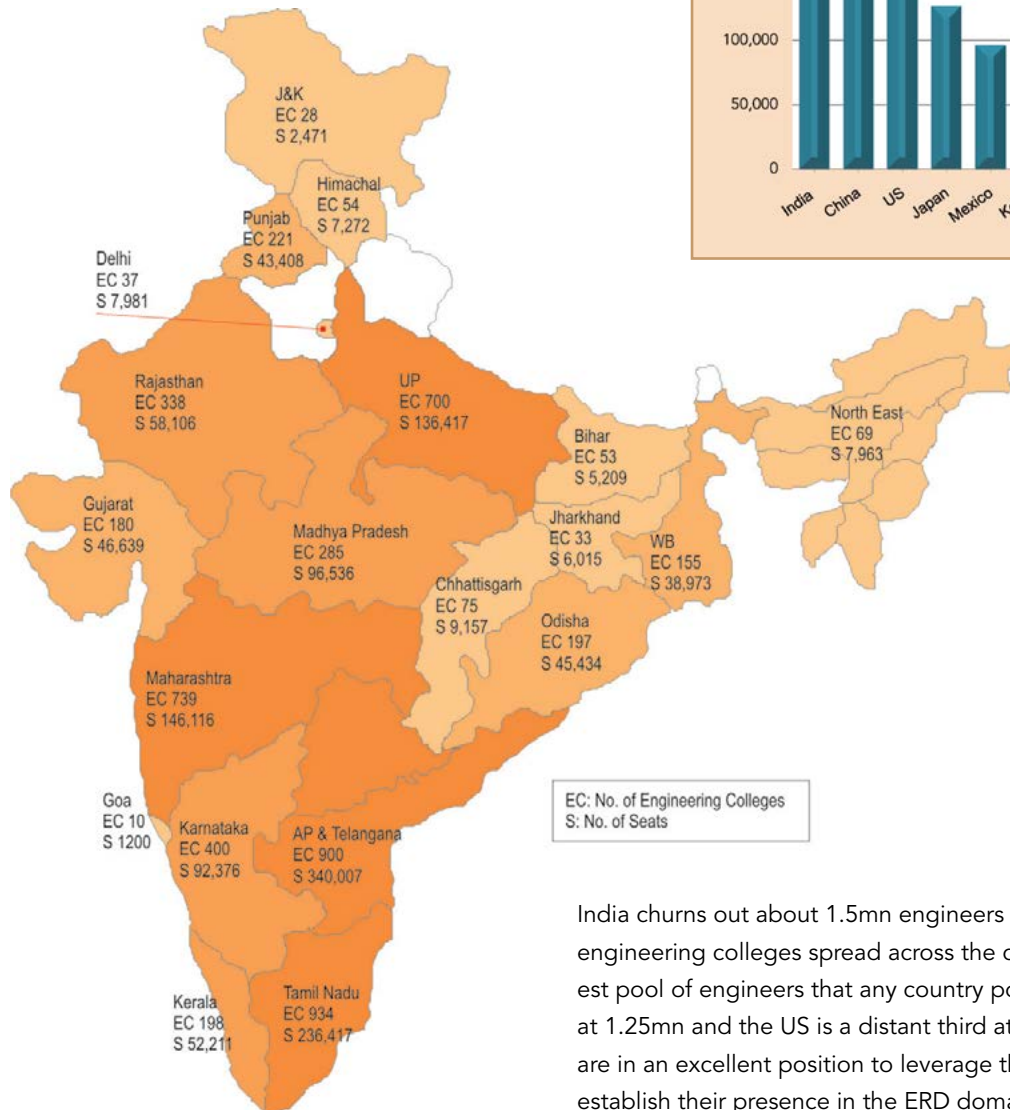

The shelf-life/life-cycle of a typical aircraft/helicopter spans about 25-30 years. Considering that the age of more than 50% of its fleet is above 20 years, the IAF will have to replace these with new procurements in the next 10-15 years. Around 650 aircrafts are estimated to be acquired during the 12th plan period compared to around 300 during the last five years.

Indian IT companies: The supply advantage

While the complexity of the ERD vertical is a challenge for Indian IT companies, it also offers a much bigger and lucrative opportunity. The fact that the segment requires engineers with a high level of understating of the various domains and to be trained on various design platforms places the Indian IT companies on a superior pedestal as compared to global competitors, primarily because of the mammoth pool of engineers that the country possesses.

Source: OECD, AICTE

India churns out about 1.5mn engineers every year, from around 6000 engineering colleges spread across the country. This is, by far, the highest pool of engineers that any country possesses; China comes second at 1.25mn and the US is a distant third at 170,000. Indian IT companies are in an excellent position to leverage this huge pool of engineers to establish their presence in the ERD domain.

Potential for Indian IT companies

Indian IT companies have an unprecedented opportunity to make ERD their forte over the next decade. The opportunity is driven by both demand- and supply-side factors. On the demand side, there is an increasing level of acceptance of the ESO model, driven by the need for companies to reduce cost, reduce time-to-market, and capture emerging-market opportunities. On the supply side, Indian companies have the world's largest pool of engineers at their disposal, providing them a highly competitive and inimitable advantage.

Indian companies can enhance their presence in the ERD domain on three fronts:

New clients: Leveraging their performance with the existing client base in the ERD domain, Indian IT companies can tap new clients—companies that have not outsourced till date.

Cross-selling to existing clients: Indian IT companies currently service many companies that spend significantly on ERD, but have outsourced other IT operations (ADM, IMS).

Cross-selling to these companies should be relatively easy.

Moving up the value chain for existing ERD clients: In addition, companies can move up the value chain by engaging with their existing ERD customers on a more strategic level and capturing a larger share of their wallet.

Amongst the large Indian IT companies, HCL Tech and TCS have a significant presence in the ERD domain and are the potential beneficiaries of increased outsourcing towards this domain. Amongst smaller companies, Cyient, KPIT Tech, and Geometric Software's businesses are inclined towards this domain and could be potential beneficiaries. However, almost all IT services companies that have a presence in the manufacturing vertical have been trying to make inroads into this domain. Given the abundant pool of engineers available to them, it will not be surprising if a few new names make significant inroads into this domain over the next decade.

"Forget mundane work, Indian IT companies are now designing even the landing gear for aircrafts for top aerospace companies of the world"
- Head of manufacturing of one of the top-4 Indian IT companies

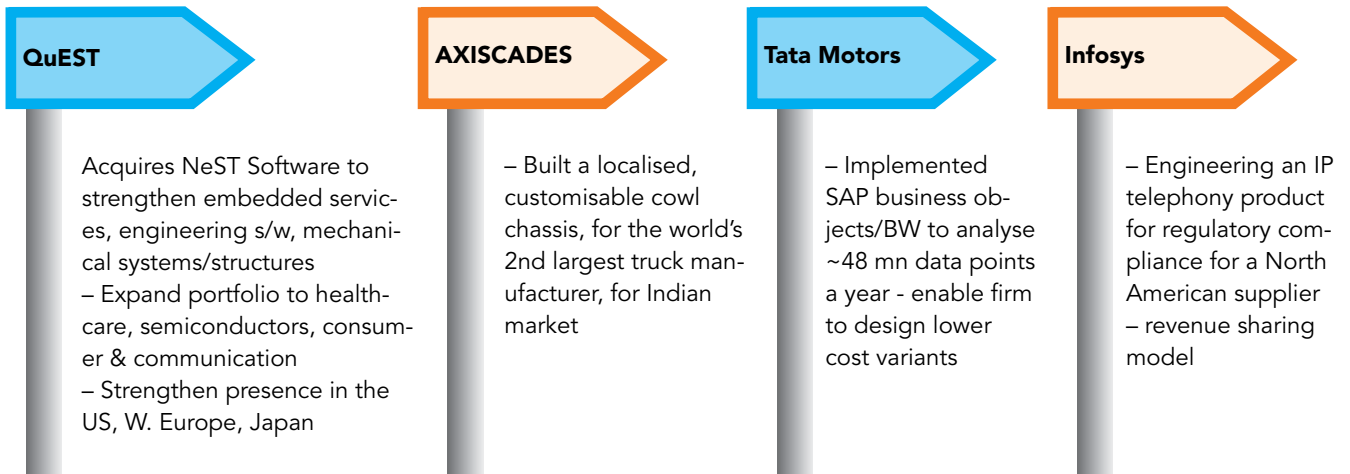

Key ESOs in each vertical

	Automotive	Aerospace	Energy & Utilities	Consumer Electronics
Captives	Bosch	Airbus	Shell	Samsung
	Daimler	Honeywell	Petrofac	LG
	Ford		Schlumberger	Phillips
Third party	KPIT	Cyient	Wipro	TCS
	Infosys	HCL Tech	Quest	Mindtree
	Tata Technologies	Tech Mahindra	Geometric	HCL
		TCS	Aker Solutions	Tata Elxsi

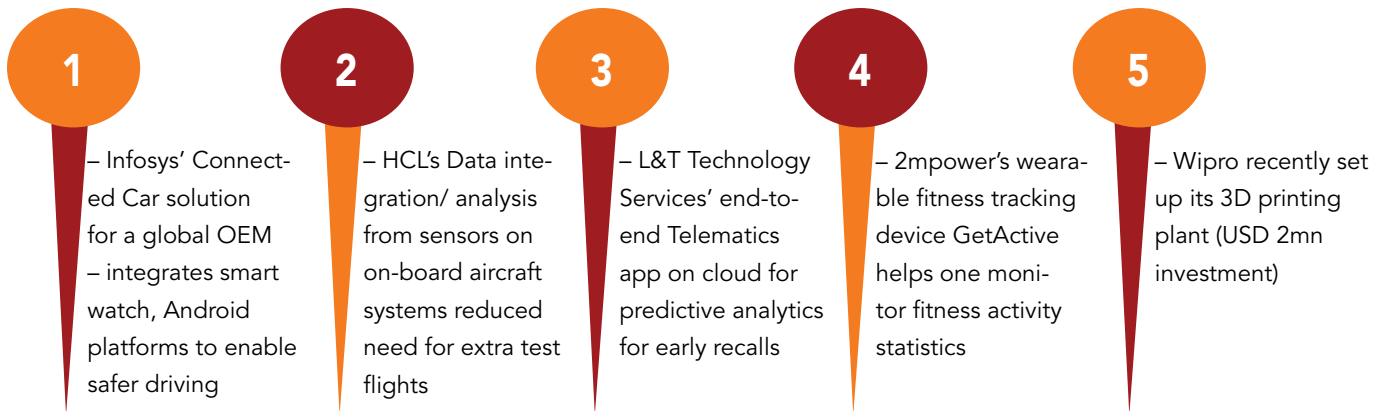

Key strengths of the key companies

TCS	Infosys	HCL Tech	Wipro	Tech Mahindra
All sectors - Auto/Aero/Consumer Electronics	Overall weak presence - mainly Aerospace	Avionics	Medical devices	Product design
Geometric Software	Quest	Cap Gemini	IBM	Accenture
Product Lifecycle management	After sales - esp for aerospace	Technical Publication / Documentation	Process Consultation / PLM implementation	Process Consultation / PLM implementation

Rapidly evolving eco-system

Case Study – Make in India

The ESO domain in India is also likely to benefit immensely from the 'Make in India' initiative by the new Prime Minister, Mr. Narendra Modi. The Modi government is trying to revive the manufacturing sector in India, by luring global MNCs to start manufacturing their products in India. At the same time, the government will try to promote growth of local manufacturing firms, along with focus on skill development for the workforce.

The government intends to increase the share of manufacturing in India's GDP to 20% by 2020 from 14% currently. That would entail a potential US\$ 8bn opportunity for the Indian IT sector, over the same period. Large part of this opportunity will come in the form of higher ESO spending, as local as well as global manufacturing companies outsource higher quantity and quality of R&D work, to the Indian IT companies (captives or third-party). Govt policies like favourable and transparent tax regime, investments in

dedicated freight and industrial corridors and implementation of its skill development programmes are expected to provide the necessary impetus for the sector.

Execution Plan

DK Vyas, CEO, Srei BNP Paribas,

shares his view on the current situation of the construction and mining-equipment industry and emerging trends in the sector

Srei BNP Paribas is the largest construction- and mining-equipment financier in India with an AUM of around Rs 190bn. It is a 50:50 joint venture between Srei Infrastructure Finance Ltd and BNP Paribas Lease Group, the largest leasing group in Europe. Last two years have been poor for infrastructure with many projects getting stalled and very few new projects coming up. In our interview with Mr DK Vyas, Chief Executive Officer, Srei BNP Paribas, we discussed the current situation of the construction- and mining-equipment industry and emerging trends in the sector

BY PRADEEP AGRAWAL & MANISH AGARWALLA

Q. What is the overall size of the equipment-finance industry in India? What is your market share?

A. The total size of this industry should be about Rs 250-300bn. Around 50% of the sector comprises loaders and excavators. We are the leading player in the infrastructure and construction equipment (ICE) segment with over 30% market share. We have partnerships with more than 210 leading domestic- and international-equipment manufactur-

ers and hold 20-40% market share across leading OEMs such as JCB, Volvo, TATA, and L&T. With other financiers exiting the business, we will dominate and maintain our leadership position in the market.

Q. Can you throw some light on your customer profile and the segments that you operate in? How do you see your NIMs shaping up over the next 2-3 years?

A. We cater to a wide range of customers including project

owners, large fleet owners, first-time owners, and first-time buyers. Around 65% of our customers are wholesale and 35% are retail. While 90% of our CME (Construction and Mining Equipment) portfolio is comprised of new equipment, 10% is in pre-owned equipment. We aim to take our pre-owned equipment share to 20% by FY18. We are also diversifying into other segments such as IT, health care, material-handling equipment, and tractors. The change in product mix towards higher-yielding segments will aid our margin improvement. We expect NIMs to improve substantially in the coming 2-3 years.

Q. What makes SREI different from other ICE financiers?

A. We are an end-to-end solutions provider present across the value chain starting from procurement to disposal. Be it asset purchase, asset deployment, asset management and asset resale, we are present across the value chain. We also advise our retail customers on what type of equipment would be ideal for their projects. In cases where a customer is not able to deploy his assets, we help him in deploying his assets in our own projects or other projects where we have relationships. The SREI group has interests in eight road projects of which four are operational. We also have around 56 yards across the country to take care of the assets' wear and tear. This helps in better customer-relationship management. We have a client base of more than 40,000 customers.

Q. From the industry perspective, which segments are seeing higher stress? Any particular geography or regions that are more stressed?

A. Stress is seen across all infra segments such as mining, road, and construction. In road, equipment cost constitute 20-25% and in mining, equipment cost constitutes almost 40-50% of the overall project cost. With lot of projects getting stuck in the last two years in road and mining, utilisation levels of equipment went down significantly. This impacted the repayment capability of equipment owners. South region is relatively showing more stress, especially Andhra Pradesh—most of the sales of construction and equipment happen in this region as the largest number of construction companies and contractors come from here; the problem has escalated after the split of the state.

Contract mining is doing well, while project mining has not picked up yet. Road segment is showing some signs of improvement as around Rs 250bn worth of road projects are underway—these include EPC road projects worth Rs 200bn where tenders have already been in process.

Q. What are the major challenges in the ICE sector?

A. Large number of stalled projects (due to environmental issues, land acquisition, and funding issues) has been affecting corporate cash flows. Many claims are stuck with the government in various projects like roads, where there is change in scope of work (like change of routes).

If you look at our customer profile, around 65% of the buyers are strategic while instead of with 35% are retail. Most of these strategic customers are facing cash-flow problems as their payments are stuck. Retail segment is also facing problems as it is not able to deploy equipment due to lack of operational projects.

Q. What is the capacity utilisation level in the system? How do you read it?

A. There is no exact data on this, but our interaction with customers suggest that the idle capacity in the system should be around 25-30%, which is the highest in many years. We do not expect the idle capacity to come down significantly in the next 6-9 months. Over 1-2 years, we expect this to come down to 5-10% as the economy picks up.

Q. How has the resale price moved in the last year?

A. There is not much activity in the resale market as utilisation is at its trough. Over the last two years, resale prices have been declining and in the last one year, there has been a fall of another 10%. With pick up in utilisation over the next 1-2 years, we expect the price in the resale market to stabilise.

Q. What is your cost of funds? What is your outlook?

A. The cost of funds stood at 10.8% in the last quarter. We aim to reduce cost of funds through diversifying with wide spectrum of lenders. We are exploring new avenues and increasing the share of retail funding through options like NCDs. We have recently closed our maiden public issue of NCD, and raised Rs.4.1bn.

Q. What is your growth guidance for the current year? How do you see asset quality going ahead for SREI?

A. We expect the industry to grow by 5-10% in FY16 and 18-20% in FY17. The growth will be driven by road and urban infrastructure, construction, and contract mining. Construction equipment picks-up first as the equipment find use in other segments as well. This will be a year of impact and we expect provisions and write-offs to remain similar to last year's levels. At the same time, we do not see things getting worse from current levels and expect GNPA to come down to moderate levels by FY18.

Disclosures and Disclaimers

PhillipCapital (India) Pvt. Ltd. has three independent equity research groups: Institutional Equities, Institutional Equity Derivatives and Private Client Group. This report has been prepared by Institutional Equities Group. The views and opinions expressed in this document may or may not match or may be contrary at times with the views, estimates, rating, target price of the other equity research groups of PhillipCapital (India) Pvt. Ltd.

This report is issued by PhillipCapital (India) Pvt. Ltd. which is regulated by SEBI. PhillipCapital (India) Pvt. Ltd. is a subsidiary of Phillip (Mauritius) Pvt. Ltd. References to "PCIPL" in this report shall mean PhillipCapital (India) Pvt. Ltd. unless otherwise stated. This report is prepared and distributed by PCIPL for information purposes only and neither the information contained herein nor any opinion expressed should be construed or deemed to be construed as solicitation or as offering advice for the purposes of the purchase or sale of any security, investment or derivatives. The information and opinions contained in the Report were considered by PCIPL to be valid when published. The report also contains information provided to PCIPL by third parties. The source of such information will usually be disclosed in the report. Whilst PCIPL has taken all reasonable steps to ensure that this information is correct, PCIPL does not offer any warranty as to the accuracy or completeness of such information. Any person placing reliance on the report to undertake trading does so entirely at his or her own risk and PCIPL does not accept any liability as a result. Securities and Derivatives markets may be subject to rapid and unexpected price movements and past performance is not necessarily an indication to future performance.

This report does not have regard to the specific investment objectives, financial situation and the particular needs of any specific person who may receive this report. Investors must undertake independent analysis with their own legal, tax and financial advisors and reach their own regarding the appropriateness of investing in any securities or investment strategies discussed or recommended in this report and should understand that statements regarding future prospects may not be realized. In no circumstances it be used or considered as an offer to sell or a solicitation of any offer to buy or sell the Securities mentioned in it. The information contained in the research reports may have been taken from trade and statistical services and other sources, which we believe are reliable. PhillipCapital (India) Pvt. Ltd. or any of its group/ associate/affiliate companies do not guarantee that such information is accurate or complete and it should not be relied upon as such. Any opinions expressed reflect judgments at this date and are subject to change without notice

Important: These disclosures and disclaimers must be read in conjunction with the research report of which it forms part. Receipt and use of the research report is subject to all aspects of these disclosures and disclaimers. Additional information about the issuers and securities discussed in this research report is available on request.

Certifications: The research analyst(s) who prepared this research report hereby certifies that the views expressed in this research report accurately reflect the research analyst's personal views about all of the subject issuers and/or securities, that the analyst have no known conflict of interest and no part of the research analyst's compensation was, is or will be, directly or indirectly, related to the specific views or recommendations contained in this research report. The Research Analyst certifies that he /she or his / her family members does not own the stock(s) covered in this research report.

Independence: PhillipCapital (India) Pvt. Ltd. has not had an investment banking relationship with, and has not received any compensation for investment banking services from, the subject issuers in the past twelve (12) months, and PhillipCapital (India) Pvt. Ltd does not anticipate receiving or intend to seek compensation for investment banking services from the subject issuers in the next three (3) months.

PhillipCapital (India) Pvt. Ltd is not a market maker in the securities mentioned in this research report, although it or its affiliates may hold either long or short positions in such securities. PhillipCapital (India) Pvt. Ltd does not hold more than 1% of the shares of the company(ies) covered in this report.

Suitability and Risks: This research report is for informational purposes only and is not tailored to the specific investment objectives, financial situation or particular requirements of any individual recipient hereof. Certain securities may give rise to substantial risks and may not be suitable for certain investors. Each investor must make its own determination as to the appropriateness of any securities referred to in this research report based upon the legal, tax and accounting considerations applicable to such investor and its own investment objectives or strategy, its financial situation and its investing experience. The value of any security may be positively or adversely affected by changes in foreign exchange or interest rates, as well as by other financial, economic or political factors. Past performance is not necessarily indicative of future performance or results.

Sources, Completeness and Accuracy: The material herein is based upon information obtained from sources that PCIPL and the research analyst believe to be reliable, but neither PCIPL nor the research analyst represents or guarantees that the information contained herein is accurate or complete and it should not be relied upon as such. Opinions expressed herein are current opinions as of the date appearing on this material and are subject to change without notice. Furthermore, PCIPL is under no obligation to update or keep the information current.

Copyright: The copyright in this research report belongs exclusively to PCIPL. All rights are reserved. Any unauthorized use or disclosure is prohibited. No reprinting or reproduction, in whole or in part, is permitted without the PCIPL's prior consent, except that a recipient may reprint it for internal circulation only and only if it is reprinted in its entirety.

Caution: Risk of loss in trading in can be substantial. You should carefully consider whether trading is appropriate for you in light of your experience, objectives, financial resources and other relevant circumstances.

For U.S. persons only: This research report is a product of PhillipCapital (India) Pvt Ltd. which is the employer of the research analyst(s) who has prepared the research report. The research analyst(s) preparing the research report is/are resident outside the United States (U.S.) and are not associated persons of any U.S. regulated broker-dealer and therefore the analyst(s) is/are not subject to supervision by a U.S. broker-dealer, and is/are not required to satisfy the regulatory licensing requirements of FINRA or required to otherwise comply with U.S. rules or regulations regarding, among other things, communications with a subject company, public appearances and trading securities held by a research analyst account.

This report is intended for distribution by PhillipCapital (India) Pvt Ltd. only to "Major Institutional Investors" as defined by Rule 15a-6(b) (4) of the U.S. Securities and Exchange Act, 1934 (the Exchange Act) and interpretations thereof by U.S. Securities and Exchange Commission (SEC) in reliance on Rule 15a 6(a)(2). If the recipient of this report is not a Major Institutional Investor as specified above, then it should not act upon this report and return the same to the sender. Further, this report may not be copied, duplicated and/or transmitted onward to any U.S. person, which is not the Major Institutional Investor.

In reliance on the exemption from registration provided by Rule 15a-6 of the Exchange Act and interpretations thereof by the SEC in order to conduct certain business with Major Institutional Investors, PhillipCapital (India) Pvt Ltd. has entered into an agreement with a U.S. registered broker-dealer, Marco Polo Securities Inc. ("Marco Polo"). Transactions in securities discussed in this research report should be effected through Marco Polo or another U.S. registered broker dealer
